This is the position, then, we occupy. We may be a blessing to others, or we may prove a mildew to blight and blast! Our associations may be to us a source of everlasting benefit, or we may become so contaminated by vicious surroundings that, instead of the beauty of uprightness and moral virtue and integrity, we shall present a marred, distorted and loathsome picture of shame and disgrace.

Now, I would not be understood as teaching that our individuality is necessarily wholly absorbed by our surroundings. We have power to resist an *entire* conformity to the example before us, but *cannot* escape being *more or less* affected by it, and so powerfully and stealthily does it grow upon us, that we need to use every faculty we possess in the cultivation of better principles, in order to to maintain our own. It is also true we may so exert an ennobling influence over our companions as to lift them up with us. Our chosen companions and resorts are the hidden rock upon which our bark is most in danger of being dashed to pieces. If we are unwillingly thrown among the vicious, we may to a certain extent escape pollution, but we cannot wholly. We are, in a measure, mirrors reflecting the character of our associations.

If this is true, what care ought we to exercise in the choice of our associates! And with what circumspection ought we to walk that our example be not a source of offense to any!

APOLOGIZING.

A most despisable and unworthy thing is that weak and sickly spirit we sometimes see manifested in some persons which is forever begging pardon and apologizing. No matter what is the character of the circumstance, with some the stereotyped phrase is ever ready, "I beg pardon," or "Excuse me." Often these expressions are used unthoughtlessly, but for this they are only less graceful. Too often, however, they are the promptings of a spirit so effeminate that it dare not be right if there is the least opposition. The manhood that ought to exert itself is allowed to cringe and bend till its unsightly dwarfishness is simply despicable, and we turn from it in disgust.

Equally as far from true manhood is that spirit which withholds an apology on proper occasions and under proper circumstances. This is only allied to the bully or the savage; it is never met with in the gentleman. A gentleman of truly noble character finds everywhere only unrest while his conscience reminds him of a wrong that he has not mended, or at least apologized for. We sometimes hear of persons too weak, or too vain, to apologize, but in them true dignity of character has no place. It is not pride of character, but the want of it, that withholds an apology for an insult given or an atonement for an injury done. He who really values his character will hasten to remove even the slightest stain.

Between these extremes lies the true, proper course. An apology for a wrong done is manly; an apology when no cause is given is ridiculous; to withhold an apology for an injury is stupid vanity.

Read over our list of premiums.

A STRAY GEM FROM CUPID'S COURT.

Mr. Editor: In looking over my papers, the other day, I came across the following specimen of a love-letter, and thinking it would be as pleasing, if not as instructive, as the correspondence of "Angie" and "Inglewood," I concluded to send it to the Agriculturist. The letter is a true verbatim copy of the original, and quite a joke attached to it. It was written to and received by the lady in the year 1862, while dated forward to 1865. And as the writer failed to pay postage, the lady was notified and had to send the requisite stamp.

Annie.

UP-COUNTRY LETTERS---NO. 8.

BY RACHEL A. ELY.

Rest! Oh! the magic of its power! The few know its joy only when their over-tasked bodies and brains may freely revel in its calmness, feeling it their right and duty to do so. Few of us can do this. Circumstances enchain and enslave us to such an extent that we even carry our fret and worry into our churches, and often make the day of rest one of labor and fatigue. I felt this as I lay under the cool shade tree on Sabbath last and listened to the quiet voice of my hostess, who makes Sunday a rest-day surely, cooking only a breakfast on that day. Cold meat, bread, butter, cake, milk, fruit and such fare, serves the other meals. The dishes are left for washing till next morning. So, I say, as I lay listening to my friend, who was giving me her idea of what the day of rest should, and was intended to be, and compared it with the way an old sexton, Deacon P., whom I knew, used to "enjoy" his Sunday, which he "allowed" was the hardest day of the week to him, I could but mark the contrast. Being a carpenter, he had only Sunday to trim his lamps, sweep, dust, and make ready for service. Seven or half-past found him on hand; and Sunday-school at nine, bells to ring for that and the church, Bible-class meeting after church, then home to dinner and back to light up and ring for evening service at early candle light. Nine o'clock usually found all dark and quiet at the church and he on his homeward way. What time to think or rest for the next day's duties? Ah, well, he rests well now, poor man, I trust, for he is sleeping under the sod, "till the day of judgment," as the good Baptist brothers say.

Ah, friends, God is good and just to all, and as I look up to the deep blue space above, which we childishly call Heaven, and think of the millions of other worlds floating and guided by the same Hand, my heart thrills with joy at the thought that the Power which controls them and fails not, can but be true to me and my actions, if I am but true to my self according to my ability.

I notice that your correspondent, "P. F. P.," thinks my reasoning to strong for an invalid or too weak for a well brain (?). Ah, friend, we are *all invalids* only varying in degree and intensity. Point out the well man or woman and I will be glad, for in my weakness all I meet give me their sympathy *through their own infirmities*, supposing, doubtless, that misery likes company. Then, again, invalid brains are only weak, disabled brains, not always vitiated or narcotised by bad habits, tobacco and liquor—unless, indeed, drugged as many are with medicines, in the vain hope of *purifying by adding impurities* to the system.

I cannot, of course, attend church very regularly, in my invalid condition, but I judge the teaching by the lives of those who do listen week after week, and is not that a sage way to judge? "One man cannot be everything," but if you "are not so sure that we can break a physical law without violating a moral precept in the same act, or its consequences," why is it not the preacher's duty to try to stop the breaking of a physical law, if in so doing he is *preventing* the violation of a moral precept? That's the very point, though I don't wish to "quarrel with them." Oh, no; only to beg the young men just starting on their Master's work to combine the physical with the moral and spiritual laws, both by precept and example—giving up all habits that tend to demoralize brain and body, and fearlessly advocating simplicity in life. I would simply, yet earnestly, beg all teachers to seriously consider this matter, and so work for the common good of all. I blame them not for the good they do, but pray that that should not be neglected which so much needs to be done.

CAMPING OUT.

BY BUSY BEE.

Dear mothers and house-keepers, did you ever go camping? Those who never have, know nothing of its attractions; and those who have, will agree with me I am sure, in saying it is splendid. Just take your little children, and a tent and all the requisites of a camping expedition, and go somewhere every summer. It does not matter much where. Right here in our own mountains I have spent many happy days with my family camping. And how we do all enjoy it, and how good we all feel, and what appetites we all have! I know there are many who cannot go, and a great many who think they cannot, who might if they would, or really realized the benefit they might derive from a trip to the mountains of a few days. I know it is not always easy for us to go, there are so many little things to see to on a place. But we manage to go and take the children once during the summer, and oftener if possible. It is not necessary to go to the coast, where it costs more or less. There are plenty of beatiful streams in the mountains on either side of us, where we can find lovely places to make a camp and spend a week or month delightfully. There is nothing we enjoy better, and I think all families who can ought to give themselves this treat at least once a year.

San Jose, August, 1876.

Boys and Girls.

Farmers' Boys.

BY I. S.

Out in every tempest,
Out in every gale,
Buffeting the weather,
Wind, storm and hail.
In the meadow mowing
Where the old oak stood;
Every flitting moment
Each skillful hand employs—
Bless me! were there ever
Idle farmers' boys?

Though the palm be callous,
Holding fast the plow,
The round cheek is ruddy,
And the open brow.
Has no lines or furrows
Wrought by evil hours.
For the heart keeps wholesome,
Trained in Nature's bowers;
Healthy, hearty pastime,
The spirit never clogs;
Heaven bless the manly,
Honest farmers' boys!

At the merry husking,
At the apple-bee,
How their hearts run over
With genial, harmless glee!
How the country maidens
Blush with conscious bliss,
At the love-words whispered
With a parting kiss!
When the winter evenings,
With their social joys—
Bless me! they are pleasant,
Spent with Farmers' boys.

OUR CORNER.

Well, children, another month finds us here again, as new and fresh as ever. There is one good thing about the Agriculturist, it is always new until the next number comes out. It is not like a daily paper, nor like a mushroom to grow up and get old all in the same day. It is good for a whole month, and then good to file away to be bound into a book at the end of a year to be new until the next volume is fresh bound. And after my little nephews and nieces grow up, what will afford more real enjoyment than to look over the old letters they are now writing to the Agriculturist, if they but preserve the numbers in binding?

Another summer has flown, and now comes autumn. As the weather grows milder after the summer heat, how refreshing the air, and how grateful to the palate the luscious fruits! The vegetation which has kept green during the summer always takes a new start at this season, and grows again as spring-like as possible. You will notice the pumpkin and melon vines showing this new growth very plainly. Everything freshens up by the cooler days and damper nights.

Now is a good time to start cuttings of flowers and plants, and to plant seeds of perennial plants and flowers, so the plants will bloom next summer. Ask your papas and mammas to show you how to do it, and how to take care of them.

THE GAME OF DIXIE.

Mary C. wants to know what games Aunt Polly used to play when a child. Well, very much such as you now play. I will tell you one that used to amuse us a good deal. It is an active game and takes spry children to excel at it. It is called "Dixie's Land," and I do not see children playing it now. You mark off a piece of ground twelve to twenty feet across which is called "Dixie's land," and on either side are places marked off called "base." One is appointed to be Dixie, and is his or her duty to guard Dixie's land from intrusion. The game is to run across Dixie's land without being caught by Dixie before reaching base. When over a dozen were playing at one time we used to have two Dixies and lots of fun. The one caught must be Dixie until he or she catches another, who in turn is Dixie.

And now for our letters:

Milpitas, August, 1876.

Dear Aunt Polly: I have tried to make out the puzzles. Although I had some one to help me at first, I though them very hard, yet after I studied them they came very easy. The answer to Daisy Glock's is "Animal;" to L. W., "Boy;" to the rebus, "Love me little, love me long." I found five trees and flowers—elm, pansy, sweet-pea, sycamore and cedar. The answer to Mary Clark's rebus is, "Open your mouth and shut your eyes and I will give you something to made you wise." The answer to Daisy's last puzzle is "Lazy," and to the word-puzzle, "Hyacinth."

Here are two new puzzles:

I am composed of five syllables.
My first syllable is an abbreviation of a girl's name.
My second is a kind of grain.
My third is to pick.
My fourth is a number.
My fifth is a part of the body.
My whole is a welcome visitor to many families.

Take *o* from a city in Nevada and leave an animal. Take *r* from a city in France and leave an animal. Take *a* from a city in Norway and leave what we all should be. Your Niece,

Tillie.

Livermore, August, 1876.

Dear Aunt Polly: I have not forgotten you, and never will. I go six miles to school every day in a buggy. I study reading, arithmetic, grammar, spelling and geography. We do not know many games to play. I wish you would please tell me some that you played when you were a little girl. I think Miss Otterson's little children must have a nice time riding in the morning and in the evening. I like to ride horseback better than in a buggy. At school my cousin and I, and some other little girls, ride the horses to water, nearly half a mile. We have splendid fun that way. Last Friday, as some other girls and I were loping along, suddenly one of the horses which had two girls on began to trot real hard. The smaller girl said, "I'll fall!" and before she knew it she fell off and pulled the other girl off, too. Oh! how we did laugh! For they were not hurt, and jumped up laughing. Then they mounted again, and away we went.

I send a diamond puzzle. Here it is: 1, a consonant; 2, to hasten; 3, a tract of land; 4, an animal; 5, a consonant.

Your Niece, Mary C.

Mary and her brother Tommy also send answers to Daisy's puzzle, to the word-puzzle and the word-rebus. Tommy also sends an enigma. Here it is:

I am composed of 63 letters.
My 31, 40, 45, 56 is a headland.
My 38, 26, 20, 62, 28, 17, 19, 51, 58, 39 is an animal.
My 9, 61, 25, 55, 48, 11 is wealth.

My 40, 53, 50, 46, 14 is to astonish.
My 6, 34, 50, 47, 37, 57, 54, 10, 52, 7 is throwing back.
My 3, 59, 36, 13 is a girl's name.
My 44, 41, 12, 16, 8 is to unfasten.
My 53, 1, 2, 27, 23 is a part of the body.
My 43, 5, 24, 42 is a body of water.
My 29, 52, 58, 54 is a part of the body.
My 22, 21, 49, 18 is to desire,
My 33, 56, 60, 63 is inferior.
My 32, 30, 42 is performed.
My 4, 48, 15, 35 is a coin.
My whole is very interesting.

CONCORD, August, 1876.

DEAR AGRICULTURIST: My boy Richard desires me to write a few lines to you as he feels some delicacy in writing to a newspaper editor. He has had no practice in writing letters. He incloses the amount of his subscription, and wishes to say he has not sent it before on account of "scarcity of money." All the family, consisting of four girls and two boys, are delighted with your paper, and are receiving much pleasure and profit from its perusal, as do I also. When we get a little leisure, will give you a few items from this county.

Yours, respectfully, F. W. LEWIS.

Aunt Polly persuaded the Editor to let her put this in the "Corner." Richard need not be afraid of editors. They are no bigger not better than other people. The AGRICULTURIST editor used to be a farmer's boy, and did the chores in ragged, dirty clothes with bare feet, like any other urchin. He would only feel proud now to have the little boys notice him enough to write to him. But Aunt Polly wants Richard, and all other good boys and girls, to write to her. Surely they are not, any of them, afraid of their dear Aunt Polly, who loves them so much. Little boys and girls are what men and women are made of. Be good, and you will make good men and women.

A HIDDEN PROVERB.

A proverb is buried in these lines—one word in each line:

I rose one morn and said to John,
"My man, just put the saddle on
My horse, that I may take a ride;
Just lead him to the other side
Of the house; I would a journey go,
If my good horse will take me; so
He's had enough, I hope, to eat,
And water, too, to drink.

"'Tis but a journey short I take,
Ten miles, not more, I think.
I wish to see the men who say
They cannot come to make the hay;
So now make haste, I must away;
Come and lead him out, John, if you think
He's had enough to eat and drink."

CONUNDRUMS.

Why is an over-worked horse like an umbrella? It's used up.

Which is the worst place for a rum-hole? A man's face.

What is the best motive for riding a man on a rail? A locomotive.

ONLY A PEBBLE.

BY D. G. INGRAHAM.

"It was only a pitiful pebble after all," said Johnnie, as, seating himself on the doorstep, he untied his shoe and shook out the cause of his frequent impatient exclamations during our afternoon walk.

"Yes, Johnny," I said to myself, as I sat in the easy chair in my study; "the poor, despised pebble! Mankind have worshiped the mountain at whose foot it lay; art has transformed the marble block into images of the great among men; the diamond washed to the surface by the streamlet has been polished and set in the crowns of royalty—but here lies the pebble, their 'poor relation,' unnoticed and unknown."

Did you ever think how important a part the pebble has played in the great drama of the earth's development? Poor, insignificant little fellow—so we think him—despised even by a scratching hen! But, however humble his present position, his tribe has received high honors in its day, and has a record it need not blush for.

The pebble descended from the kingly race of rocks. Long ages since—we know not how long ago, for history records only the deeds of perishing men—a noble rock lay firmly grounded near the summit of a lofty mountain. So high was his head above the green valleys below, that it was white with ever-renewed snows. One morning Monseigneur Granit was rudely awakened and pitched from his majestic couch by an earthquake. He felt himself sliding and rolling down over icy cliffs and dizzy hights each moment faster and faster. At the foot of the mountain he struck with a stunning thud against a brother rock, and was shivered into a thousand pieces, from the size of a meeting-house to that of a hazelnut. The swollen torrent of the river upon whose bank the fragments had been cast soon began rudely and unceremoniously pushing and rolling his lesser fragments down stream. As they rattle against one another their sharp corners are worn off and their sides polished by the constant abrasion. They journey on for miles, sometimes stopping for long rests of centuries in the mud and sand, only to be aroused and hurried forward by the restless waters. They sometimes overtake others of the same race and kindred, but of different colors and complexions. Some are white and nearly transparent, others are green, or purple, or blue, and of every shade and hue imaginable. All smoothed and rounded and polished by their long journey and rude jostling. They pass huge bowlders of granite so heavy that the flood cannot move them; they are themselves beaten in the oceanward race by sparkling grains of sand; they mingle with fragments of shade and flakes of mica that are making the same journey in obedience to the same power.

But they all claim descent from the royal family of rocks, that stout-hearted race that fire and flood could never conquer in the early days of Mother Earth; and now here they lie before me on the beach, the lashing waves washing their faces into renewed cheerfulness and beauty at every surge.

But do you ask what has a pebble ever done? Like many other equally obscure individuals, the pebble has had a duty to discharge, and nobly has he done it. Could he speak he might say, "War has carried me into slavery and sent me on messages of pain and death. Ages before the needle-gun and *mitrailleus*, before even the spear and cross-bow, your rude and barbarous ancestors threw me from the sling. Strong men have groaned in the hour of battle when I have struck them. The "smooth stones" which brave little David chose to kill Goliath with, were my cousins; kings and mighty men have I slain, thrown from a sling. I might say I have conquered a world. But peace has claimed me, too, and science and commerce are my debtors. The lens, whose strong arm has rift the heavens above you, is my brother. The nebula, the stellar cosmos, the fiery comet that frightened your forefathers have become familiar friends by the meditation of our family. Mt. Cenis yielded to my keen edge and your persistence.

"My humbler brothers, too, have helped in other ways. I have been carried thousands of miles holding steady the keel of the vessel and making her obey the helm. For miles around the city of New Orleans, where the great Father of Waters drags sluggishly along over sand and mud, you cannot find a pebble—not one. Yet as you ride in carriage or omnibus along the street you are surprised and annoyed at the constant thump, thump, over the rough pavement of cobble-stones. We came from the "Granite State" and the 'Old Bay State,' holding steady the empty schooner which was to carry back the bulging cotton bales.

"And now, lastly, let me tell you how one of our race found his way into literature, and if he did not find a tongue himself, saved an eloquent one from obscurity. Long years ago a young orator of Greece sauntered down to the sea shore to declaim his speech, that his voice might gain power and depth amid the thunder of the lashing waves. The barrier to his success had ever been a lisping tongue. A little pebble glistening in the sunbeam as the waters retired attracts his eye. He raises the tiny rock and places it in his mouth. It is but the pastime of an unthinking child, but speaking with the pebble in his mouth he finds his impediment removed. The tongue so eloquent lisps no longer. The last defect of nature is supplied, and Demosthenes is saved to the centuries by a pebble!"

HEALD'S BUSINESS COLLEGE, No. 24 Post Street San Francisco, Cal.

DESIGNED TO IMPART A THOROUGH English Education, a Complete Business Training, and practical instruction in Modern Languages, Drawing, Telegraphy, etc. It gives to Pupils such a **Business Education** as has made them in demand in the mercantile community, during the past thirteen years, for commercial positions. In addition, students receive a **Thorough General Training**, which fits them for their duties as citizens and useful members of society. Every young man should endeavor to secure a course of training at this School, whose course of instruction is valuable to all classes. If farmers would have their sons successful on the farm, they should send them to this **Model College of the Pacific**, where they may be thoroughly educated in business affairs, as well as in the English branches. The thorough discipline of this School, and its careful training in correct business habits, are the greatest aid to future success in any calling. Pupils may enter at any time, as each receives individual instruction. Length of time required for finishing the course is about six months. Full particulars regarding Course of Study, Terms, etc., may be had by addressing

E. P. HEALD,
Prest. Business College, San Francisco.

RUPTURE!

Use no more Metalic Trusses! No more suffering from Iron Hoops or Steel Springs! Our MAGNETIC ELASTIC TRUSS is worn with ease and comfort, Night and Day, and will, and has performed radical cures when all others have failed. Reader, if you are ruptured try one of our Comfortable Elastic Appliances. You will never regret it.

☞ Examinations Free.

MAGNETIC ELASTIC TRUSS CO,
609 Sacramento street, S. F.

J. C. BLAND & CO.,
Real Estate Agents
—AND—
GENERAL AUCTIONEERS,
312 Market St., San Jose,

HAVE FOR SALE, IN SANTA CLARA AND adjoining Counties, a very fine list of Grain and Stock Farms, improved and unimproved, in tracts from 10 acres to 10,000, which they offer upon easy terms and at low prices; also, a large list of Business and Residence property in Santa Clara and San Jose. We append a partial list. Having resided in this county for 26 years, and being thoroughly posted as regards Real Estate Values, we respectfully solicit all in search of Homes, Stock, or business of any kind to give us a call.

10 Acres near the town of Santa Clara, with fine House and Out-buildings, good Orchard, Ornamental Trees, etc. Price, $10,000.

20 Acres of Unimproved Land in the Willows, being part of the Lupton Estate. Price $3,000.

80 Acres, under fence, all in cultivation; has a House of 4 rooms, Barn and Stable-room for 15 horses, and Well, splendid water. Also, 52 acres adjoining, with Redwood House, Barn, etc., good Well; all under cultivation. Price, $75 per acre.

21 Acres of fine land, 3 miles from San Jose, east of Coyote, well enclosed, good Adobe House, Large Barn, etc. Price, $4,000.

38 Acres of fine land, 2 miles south of San Jose, lying between the Monterey Road and the Coyote Creek. The soil is unsurpassed, and the location beautiful. Will be sold as a whole, or in three subdivisions; 22 acres fronting on Coyote, at $225 per acre; 8 acres between the two residence lots, at $300 per acre; 16 acres including the fine improvements for $5,000.

60 Acres of as fine land as can be found in the county, with fine improvement. Will sell low if called for within next 90 days, must be sold in that time. Situate one mile from Lawrence Station, S. P. R. R.

18 Acres fine Vegetable Land, 3 miles southeast of San Jose, on east side of Tully Road; has a Dwelling of 6 rooms (two-story house); Barn, etc.; Orchard and Vineyard of 4 acres. Cows, Wagons, Farming Implements, etc. Price of whole, $4,500.

1,000 Acres of fine Grain and Fruit Land, located near Los Gatos, will be sold in tracts to suit at from 40 to 1000 acres. Terms easy; prices low; must be sold within 90 days.

76 Acres rolling land 8 miles west of San Jose, adjoining Reynolds' farm. Small house of 5 rooms; nice running stream of water; well fenced; with plenty of wood on the premises. Price, $2,800.

108 Acres land on San Jose and Santa Cruz road, near Los Gatos, 5 miles from San Jose; good tenant house; will produce anything; improvements consist of a dwelling which cost $2,000, a good barn, also orchard and vineyard; good well, wind mill and large tank. Terms, ⅓ cash; balance on time. Price, $55 per acre.

88 Acres fine land 6 miles west of San Jose, near Lawrence Station; well improved. Price, $100 per acre, on reasonable terms.

290 Acres 5 miles west of Gilroy; 30 acres vineyard; 10 acres orchard, all kinds of fruits; 3 living streams of water; all under fence; has a good house, barn and other out-buildings; wine cellars. Terms easy. Price, $10,000.

Stock farm of 2,000 acres, enclosed with brush fence and natural boundaries, located about 10 miles east of the 18-mile house, near Bennett's stock farm; well improved; has a good dwelling, barn, corrals, etc.; 80 head of American cattle, 45 of which are cows, balance one and two year olds. Terms easy. Price, $40,000.

42 31-100 Acres land on the road Guadalupe Mines, near the Los Gatos road, adjoining lands of F. Richmond. Terms easy. Price, $3,000.

242 Acres fine land, near San Jose; will be sold on a long credit. $6,000 cash; balance in 6 years, equal annual payments, with interest at 10 per cent per annum.

200 Acres of excellent fruit and berry land near Santa Clara depot. Price per acre, $200.

200 Acres in Alameda county, on west side of county road leading to Oakland, about one mile from Warm Springs, near Mission San Jose. It is fine black loam soil, well fenced. Has a good house and barn, etc. Price, $90 per acre; one-fourth cash; balance in one, two and three years, approved paper bearing one per cent. interest.

500 Acres of extra fine grain land 5 miles southwest of Watsonville and 1½ miles from shipping point, will yield 40 to 60 bushels per acre. Terms to suit purchasers. Price, $50 per acre.

160 Acres of pre-emption claim 35 miles southwest of Salinas City, 10 miles west of railroad terminus. Small house, good fence, out-houses, etc.; with an outside range of 800 acres, all finely watered. This is one of the finest hay ranches to be found in the country. Price, $1000; or will exchange for San Jose property.

160 Acres of fine timbered land located just on the line between Santa Clara and Santa Cruz counties. No piece of property on Santa Cruz mountains to excel it. Price, $6,000.

120 Acres fine land adjoining village of Saratoga; enclosed; title perfect. Price per acre, $50. Also, a farm of 160 acres 1½ miles south of Saratoga; good dwelling, barn, orchard and vineyard. Price, $4000.

81-Acre farm 4 miles northeast of San Jose; is a choice piece of land, with house 18x24 feet, small barn, etc. Price, $7,000.

Something New, Ladies!

Just What You Want for Yourself and Children.

DON'T FAIL to SEND FOR a PATTERN

Comfortable Combination Clothing.

THESE SUITS ARE CALCULATED FOR Healthfulness, Comfort and Convenience, and will fit the most fastidious person. Explanations accompany each Pattern. Patterns of four different styles of Suits are now supplied, viz.:

1—Flannel Combination Suit (shirt and drawers in one) Pattern, post paid..30 cents
2—Cotton Combination Suit (shirt and drawers) Pattern, post paid.....35 cents
3—Excelsior Suit (waist and drawers in combination), Pattern, post paid..40 cents
4—Waist and Skirt, close-fitting elegant combination, Pattern, post paid...50 cents

Nos. 1 and 2 are suitable for children as well as grown people. Nos. 3 and 4 are for Ladies especially.

THESE STYLES OF UNDERCLOTHING FOR Ladies have been found by all who have used them, the most comfortable, comfortable, as well as economical of any now in use. Models were exhibited and attracted much commendation at the late Fair.

Patterns can be had by applying to **Mrs. Herring**, east side of Ninth street, between St. John and St. James streets, San Jose, (where samples can be seen,) or by addressing

C. C. C. Company,
Box 686 San Francisco.

This reform underclothing has been worn by the Editor's wife and children for the past two seasons, and is certainly superior in points of comfort, healthfulness, and economy of wear and material of any ever invented. They are the invention of a California lady who makes every pattern herself and writes full directions upon each. No family that once tries these styles of clothing will ever go back to the others.

SAN JOSE
ASBESTIAN STONE WORKS

THE ASBESTIAN IS AN ARTIFICIAL STONE superior to any other for Cemetery Work, Building Fronts, and substantial and fine work generally. Elegant designs can be moulded so as to resemble the finest cut Stone. It is warranted to be Stronger and More Durable than Sandstone or Marble.

MR. J. W. COMBS,
(late of the Excelsior Marble Works) has engaged in its manufacture in San Jose, and can be found in the same building occupied by Albert Lake's Box Factory, near the C. P. R. R. Depot. ☞ Fine Sculpture Work in Marble a Specialty. J. W. COMBS.

Gloves Gloves.
CHEAP, COMFORTABLE, SERVICEABLE
THE ANGORA
ROBE AND GLOVE CO.,
OF SAN JOSE, CAL.,
Are making a Specialty of Manufacturing all styles of Gloves from the Angora Goat Skin, and claim for them:

1st.—They are cheaper than buckskin gloves.

2d.—The skins are tanned with the grain on, and are very nearly water-proof, and when, by long exposure, they are wet, they dry out perfectly soft—as good as new.

3d.—They will out-wear the best buckskin gloves.

4th.—For a HARVEST GLOVE, they have no equal.

These articles are manufactured in all styles, from the cheapest Laboring Glove to the Finest Fur Gauntlet. Also, all descriptions of
FURS, ROBES, MATS, RUGS, Etc
Which, for Beauty, Durability, and Cheapness, are inferior to none.
Buckskin Gloves, Mittens, Etc.,
In all varieties, and as good as the best.

Save $50! Why Pay $85?

Sewing Machines

REDUCED PRICE, $35.

Home & Home Shuttle Sewing Machines

Reduced to Live and Let Live Prices.

THESE MACHINES ARE ALL SUPERIOR to any and all; nice sewers, straight needle, two threads, shuttle, lock-stitch, the simplest and cheapest, and the lightest running first-class machines in the market. To see is to convince yourselves. ☞ Remember, all Home and Home Shuttle Sewing Machines have the Hall Treadle attached without extra charge.

THE HALL TREADLE

For Sewing Machines,

THE MOST IMPORTANT IMPROVEMENT EVER MADE.

It saves labor and preserved health. No more diseases and deaths, side or back aches from using sewing machines. No teaching required. A child can run it. Always starts the right way. Never goes backwards and breaks things. Can be stopped instantly. With it on your machine, you can do double the work you can do without it. Fifty stitches can be made with one pressure of one foot. Approved by the Massachusetts State Board of Health (see official report, 1872), Massachusetts Medical Society, and Massachusetts Charitable Mechanics' Association. The HALL TREADLE is a part of all HOME MACHINES sold by me.

☞ The Hall Treadle can be attached to any other sewing machine. Remember this. We will attach it only to any machine. It will cost you only $12, and will save you a deal of hard work and trouble.

THE HALL TREADLE GRINDING MACHINE

Must be seen to be appreciated. For a Farmer or Mechanic to own it, is to buy one. It is an indispensable article in every house, shop or hotel.

THE HALL TREADLE JIG SAW AND BORING MACHINE

Is an accomplishment in every workshop. The Hall Treadle is applicable to all machinery requiring a foot power—Sewing Machines, Grindstones, Jig Saws, Turning Lathes, Jewelers' and Dentists' Lathes, etc. Send for circulars.

OUR MACHINIST.

In connection with my regular business, I have a fine MACHINE SHOP, for repairing all kinds of machines and like work, and have employed MR. CHARLES C. REDMOND, a skillful Mechanic, as manager, and am now prepared to repair machines and machinery, make models, etc., on the most reasonable terms, and ALL WORK GUARANTEED.

A. C. PERKINS, Ag't for Santa Clara Co.

To the Working Class.—We can furnish you employment at which you can make very large pay, in your own localities, without being away from home over night. Agents wanted in every town and county to take subscribers for The Centennial Record, the largest publication in the United States—16 pages, 64 columns; Elegantly Illustrated; Terms only $1 a year. The Record is devoted to whatever is of interest connected with the Centennial year. The great Exhibition at Philadelphia is fully illustrated in detail. Everybody wants it. The whole people feel great interest in their country's Centennial Birthday, and want to know all about it. An elegant patriotic crayon drawing premium is presented free to each subscriber. It is entitled "In Remembrance of the One Hundredth Anniversary of the Independence of the United States." Size, 23 by 30 inches. Anyone can become a successful agent, for but to show the paper and picture and hundreds of subscribers are easily obtained everywhere. There is no business that will pay like this at present. We have many agents who are making as high as $20 per day and upwards. Now is the time; don't delay. Remember it costs nothing to give the business a trial. Send for our circulars, terms, and sample copy of paper, which are sent free to all who apply; do it to-day. Complete outfit free to those who decide to engage. Farmers and mechanics, and their sons and daughters make the very best of agents. Address, THE CENTENNIAL RECORD, Portland, Maine.

PROCLAMATION.

Chicago & Northwestern Railway.

Is the popular route overland to the East.

Passengers for Chicago, Niagara Falls, Pittsburg, Philadelphia, Montreal, Quebec, New York Boston, or any point East, should buy their trans-continental tickets via the pioneer route,

THE CHICAGO & NORTHWESTERN R. R.

This is the Best route East. Its Track is of Steel Rails, and on it has been made the Fastest time that has ever been made in this country. By this route passengers for points east of Chicago have choice of the following lines from Chicago: **Pittsburg, Fortwayne and Chicago and Pennsylvania Railroads:**

2 Through trains daily, with Pullman Palace
2 Cars through to Philadelphia and New York on each train.

1 THROUGH TRAIN, WITH PULLMAN PALace Cars to Baltimore and Washington.

By the Lake Shore and Michigan Southern Railway and Connections (New York Central and Erie Railways:

2 THROUGH TRAINS DAILY, WITH PALACE
2 Drawing Room and Silver Palace Sleeping Cars through to New York.

By the Michigan Central, Grand Trunk, Great Western and Erie and New York Central Railways:

2 Through trains, with Pullman Palace Draw-
2 ing Room and Sleeping Cars through to New York to Niagara Falls, Buffalo, Rochester, or New York City.

By the Baltimore and Ohio Railroad:

2 Through trains daily, with Pullman Palace
2 Cars for Newark, Zanesville, Wheeling, Washington and Baltimore without change.

This is the Shortest, Best, and only line running Pullman celebrated Palace Sleeping Cars and coaches, connecting with Union Pacific Railroad at Omaha and from the West, via Grand Junction, Marshall, Cedar Rapids, Clinton, Sterling and Dixon, for Chicago and the East.

This popular route is unsurpassed for Speed, Comfort and Safety. The smooth, well ballasted and perfect track of steel rails, the celebrated Pullman Palace Sleeping Cars, the perfect Telegraph System of moving trains, the regularity with which they run, the admirable arrangement for running through trains to Chicago from all points West, secure to passengers all the comforts in modern Railway Traveling. No changes of Cars and no tedious delays at Ferries.

Passengers will find Tickets via this Favorite Route at the General Ticket Office of the Central Pacific Railroad, Sacramento, and in all the Ticket Offices of the Central Pacific Railroad.

ALARMING DISEASE AMONG CHERRY TREES.

Several cherry orchards about San Jose have, within the last two or three years, showed the presence of some disease which has alarmed and puzzled the orchardists not a little. The trees, one by one, in portions of the orchard, would commence dying at the top. The topmost limbs would die first, and so down till, in some cases, the entire tree would die. In others, after a few of the main limbs died, the trees would take a new growth from the bottom limbs and show signs of recovery. We have visited several orchards and undertaken to ascertain the cause. No orchardist could account for the trouble. There were no signs of insect stings or poison in the diseased parts. Some thought the hot sun had scalded the upper limbs, which were apparently not sufficiently supplied with the circulating sap of the tree. We concluded that the trouble must be somewhere in the root, as we knew that a disease of the root would affect trees in just this way. Cherry trees, orange, and some other trees, growing in soil with a heavy, wet, stagnant sub-soil, have been known to suffer from rotting of the lower roots, which the trees would first show signs of in the top, just as these cherry trees do that are affected. But in this case the cherry trees are growing in high, light, well drained soil.

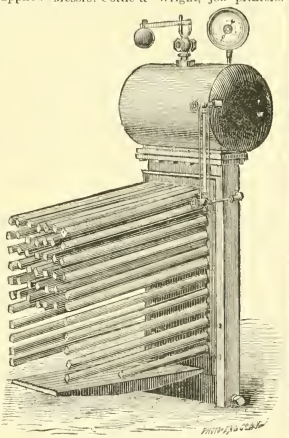
We had an idea that a bed of gravel might underlie the surface soil a few feet down, and that the roots running into this might become affected by a dry, fungoid rot. So, after due consideration, we went into Judge Archer's orchard, and with his man, spent half a day with spades hunting for the cause. We first ascertained that the trouble was not in the sub-soil. But after a careful search about the crown of the roots and trunk, we found that every tree that showed signs of disease had been gnawed by gophers. A little gnawing about the roots would cause a slight affection at the top of the tree, and a tree two-thirds or three-quarters girdled about the roots would be diseased in like proportion.

The gophers do not gnaw the roots off, but girdle close about the trunk where the roots branch from it. Several trees which we found dead were entirely girdled. A number of trees showing signs of recovery had been gnawed some last year or the year before, and not any this season.

Cherry trees are too valuable to be damaged or lost in this manner. Fair-sized trees will yield in value from $20 to $50 each season to the tree. Now that the cause is positively known, and the mystery dispelled, we trust that means will be at once taken to destroy the gophers. A few hundred dollars spent for traps and poison and labor will pay the biggest kind of a per cent. by saving valuable trees from further damage and destruction.

Every grower of cherry trees knows how damaging to a tree is a large wound of any kind. The removing of a large limb may, by the exuding of gum, cause the death of the tree. The gum exudes badly at the roots where the gophers gnaw away the bark, but the dirt acts as an absorbant and has a curative effect. A cherry tree may recover from some gnawing, but cannot withstand much without severe injury. Nothing less than complete extermination of all gophers in orchards should satisfy.

The office of the CALIFORNIA AGRICULTURIST has been removed to 338 First street, in the same rooms occupied by Messrs. Cottle & Wright, job printers.



Boiler with Fire-box Removed—showing position and arrangement of tubes and grates

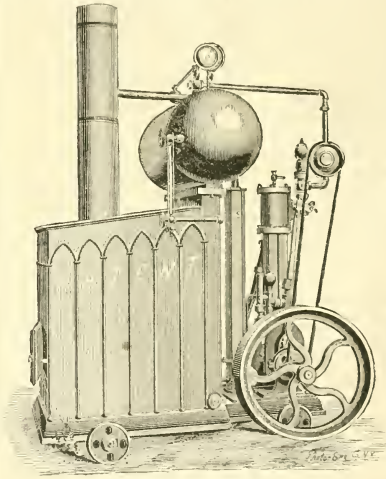
TEMPERANCE HALL.

Mr. Jesse Hobson, the noted temperance worker of San Jose, has just completed a new building, on the corner of Ninth and St. James streets, to be devoted to temperance and education. This he has done at his own expense, for the free use of the community. As it is just opposite the Editor's residence, we feel particular pleasure in noticing the fact. It is better than a whisky saloon opposite one's door, such as existed where we once lived on Third street.

Long live Jesse! say we, and may his voice continue to ring out for temperance, education and reform!

KING'S PATENT BOILER AND ENGINE.

We do not make a practice of advertising anything on this page for pay, but admit the cuts of this splendid engine as an advertisement here, *believing it to be the very best engine and boiler, for such purposes as it is designed, that was ever yet manufactured.* Several of them now in use in San Jose give better satisfaction to the persons owning them than any others have ever done. Mr. W. W. Cozzens and Mr. Oliver Cottle, both orchardists in the "Willows," have them, and find that they use less fuel than any other boiler and engine of like capacity and power. The proprietors of the San Jose Feed Mill, on the Alameda, where they grind all kinds of grain for feed at $2 per ton, tell us that it is the best boiler and engine they ever saw. They cannot say enough in its praise to do complete justice to it. Mr. Tarleton, orchardist, San Jose, who already has a first-class boiler and engine, bought new this year, and who has thoroughly examed the merits of all the leading ones, regrets that he had not seen this one before he bought. Mr. Joseph Holland, orchardist, San Jose, has been the rounds trying all the different engines, and making inquiries to ascertain the comparative merits of each before ordering, and will take this kind. He recognizes several important points of superiority over any other. One of the smallest size—a two-horse power—is now in operation in the *Argus* office, First street, San Jose, to run the new cylinder press just set up in their new rooms.



Engine and Boiler Complete.

The illustrations here given will show the peculiar construction of the boiler. Instead of flues surrounded with water, tubes holding the water to be heated are surrounded by the flames. The largest possible heating space is thus gained, while at the same time there is no large body of water or steam subject to explosion.

There is no safer boiler made, or one more economical of fuel. The engine is not close enough to the boiler to get heated, although it rests upon the same cast bed-piece. The crank-motion is at the *base*, thus avoiding unnecessary strain and jar. It is mechanically a triumph in every respect; easy to understand and to run, safe from destructive explosions, and cheaper and more economical than any other of equal power.

Its merits deserve to be understood. Mr. R. E. Wilber, 450 First st., San Jose, is the sole agent for this Coast. Persons wanting engines sho'd at once acquaint themselves with the advantages of King's Patent Boiler and Engines.

Mr. Wilber will forward further information to any address upon application.

There are several sizes and different powers, and all orders can be filled within reasonable time. This machine has only begun to be introduced on this Coast, but the names of all persons using them here will at any time be cheerfully given to such as may wish to make inquiries of them as to how they like the King Boiler and Engine.

The Honey Country.—One peculiarity about the honey region in Southern California is freedom from fogs and cold winds. Although near the sea, the climate is singularly favorable for the flight and continuous working of the bees.

CALIFORNIA exchanges will confer a favor by noticing that this journal is offered three months on trial for ten cents.

EDITORIAL NOTES.

What do you think of "The Gipsy Girl"? We shall never make an offer of any premium of an inferior or "cheap" order. It is as much for our interest as yours to give satisfaction, and we shall ever aim to squarely do it.

To Our Friends.—Every one of our subscribers who likes the AGRICULTURIST is specially requested to send us in the names of friends and neighbors for three months on trial. We mean business, and know that two thirds of all who read the CALIFORNIA AGRICULTURIST three months will subscribe for a year. Send us the names, and we will take the chances any way.

The present hard times for money, low prices for produce, etc., set people to seriously thinking about economizing in every way. Of course, no intelligent person looks upon providing suitable reading for a family as extravagance. It is more of a necessity in our present condition of civilization than a mere luxury. But where the amount of money to pay for reading is limited, this journal, at only $1.50 a year, has stronger claims for patronage than many higher-priced ones. At any rate, it will give as much for a little as any other paper published.

A Little More "Aid."—The so-called "fruit distillers" are making extraordinary efforts to get clear of the government tax, and say that without such "aid" "the interest must suffer," etc. Let is suffer, say we, till they are driven to make a better use of it than rotting and manufacturing it into a pois to ruin mankind. Convert your grapes and other fruits into food, such as raisins, dried fruits, canned fruits, pork and other meats. As though there were no BETTER uses for fruit than making liquors! Verily, "alcohol is a thing evolved out of a rotten substance. It is the terrible essence of decay; it is the very living spirit of the putrid. Science has shown that it is neither food nor fuel. It is simply an irritant, and this was its effect from its first titillation to its last agony in delirium tremens. It is a lying spirit. Its distilleries can be honestly gauged by no government under heaven, nor its treacherous drug fairly meted out by any measure yet invented by man, nor its taxes honestly paid under any system of revenue. The worm of the still is crooked in the grain and cannot be made straight, and it is a worm that dieth not, that gnaweth ever.', It is a "business" by which a few are trying to live off from others' degradation and ruin. It is perfectly natural that they should try to evade the tax. While we are opposed to licensing any evil, we hope to see no special favor to such as are in our own State and midst. By the way, we notice that the fruit distillery No. 187, belonging to T. A. Giaque and situated at Hot Springs, Napa county, was seized last month by Deputy Collector Frost, of Sacramento, for violation of the revenue laws in shipping liquors without stamps. The property seized is valued at about $9,000, and includes 650 gallons of proof spirits and 26,100 gallons of wine. The seizure was made upon the complaint of agents Crane and Clark, and United States District Attorney Coghlan has been notified to begin proceedings for confiscation. We wish there was a law to destroy all such confiscated stuff.

"Hard times" is no idle cry. Times are hard, and will be harder before they are easier. The causes, which are national, will not be removed by either the Democratic or Republican parties, whichever may elect their President. Both platforms are pledged to "hard money and contraction," at the dictation of bondholders and Shylocks in both Europe and America. The money power is held, not by the people in the interests of the people, but by their creditors, and in their interests solely. Industry is taxed and nearly strangled to death. Thousands are compelled to be idle, and while real estate, and manufacturing and producing run people in debt, and all real values depreciate, money extorts unjust tribute and grinds into lower depths a suffering people. Gold, which we have not, is demanded for payment of bonds and interest on debts contracted with paper money. Our honest, non-interest-drawing national paper is being withdrawn from circulation. Bonds deposited with Government will draw 6 per cent. interest in gold, and an issue from Government of more than twice the amount deposited in national bank notes, which are drawing from borrowers 12 to 25 per cent. more annually! This we mention as but a sample of the way the financial affairs of this Government are now being run. High salaries and premiums for rascality, monopolies and a hard-money aristocracy are in the ascendant, and are bound to triumph until such a revolution is inaugurated in this country as shall sweep everything before it. The sooner such of us as are in debt sacrifice whatever is necessary to get out, the better. No such crushing force was ever before set in motion to despoil labor, rob industry and discourage honest enterprise. Such of our people as have homes and can make a living by producing the most of what they consume, independent of the world, are the ones who will suffer the least. It behooves everyone to husband his resources, get of debt in, keep out, economize, and so ward off from his own and his family's heads as much of the surely impending ruin as possible. Our nation is already bankrupt; our industries are paralized; our people are virtually enslaved to the money kings and their allies, who are in every way drawing closer the strings that ensnare us, and who are squeezing out the earnings and even the vitality of productive labor. It is none too soon to sound the tocsin of alarm. Let him who is not blinded take heed.

Employ the Boys and Young Men. The following circular explains itself, and should be memorized:

YOUTHS' DIRECTORY AND BOYS' SHELTER, 530 Bush st., S. F., Sept. 9, 1876.

In furtherance of a good cause, please inform your readers, especially in the rural districts, that we constantly have on hand a large number of strong, active, honest, responsible young men from 15 to 21 years of age, most of whom were born in this country (no hoodlums or puny striplings), who are ready and eager for any opportunity to render faithful service by contract at the rate of 50 cents per working day, beside board and lodging, with fare advanced, the latter to be deducted from their earnings. We make no charges to employers or employees. This institution is maintained by gratuitous contributions.

Help our boys against the encroachments of the Chinese coolies in their competition for labor. In the battle of life and the struggle for existence on this Coast, let the fitter race, the higher type of humanity survive.

Respectfully yours, A. P. DEITZ.

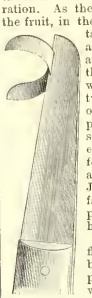
We will add here that Judge Archer, of San Jose, employed boys this season to gather his cherry crop, which netted him over $3,000 clear of expenses, and he was well satisfied with their work. Give the boys a chance to make worthy, industrious men, by making a living and learing how to do business for themselves. Upon the saved earnings of a few years, the young men who get steady employment can go into business for themselves. The hope of this nation is young men and boys. Let us all do our duty by them.

Short-horn Beef and Milk Stock. We visited Col. Younger's herd of Short-horns while they were in training for the State Fair. There can be but one opinion concern ing his stock by any unbiased judge of good stock that visits and examines them on the Forest Grove Farm. They are all carefully bred, well cared for, and, by constant intermingling of best strains of noted breeds, are being constantly improved. The Col. makes the science of breeding a study and practice. While most herds of Short-horns are being bred for beef-making points alone, or to pedigree irrespective of points, this herd is noted for its fine milking qualities. There are several as fine milch cows among them as can be found anywhere. This is of more real value, and a better recommendation to this herd than many might imagine. In fact, for this State, such fine milk stock is invaluable. We did frame out a special article on this subject, but other matters prevent its appearance.

Floral Work for the Month. The planting of bulbs for early blooming should be done this month, in raised beds, so that no water will stand upon them during the winter. Prepare the soil and plant, in this climate, just the same as Vick or Trumbull advise in their catalogues, which may be had for the asking. There is nothing that will give better satisfaction in a garden than a good selection of flowering bulbs, properly arranged and cared for. Send for the catalogues and be governed by advice found there.

TARLETON'S CLING STONE FRUIT PITTER.

Our friend Mr. G. W. Tarleton, a leading orchardist, has just invented a simple little device for removing pits from cling-stone fruits. The illustration we here give will show what it consists of—a half circle cutting attachment to a common knife-blade, with this instrument the fruit is halved and pitted at one operation. As the knife is drawn around the act of halving, the attachment is drawn over and fitted about the pit, and follows it around as the knife is turned, so that when the fruit is cut in two the pit is also scooped out as clean and slick as possible. Everyone who sees it work is filled with exclamations as to its perfect working, simplicity and excellence. The San Jose canning and drying factories have had a supply made at once, and are highly pleased with them.



The superior excellence, firm flesh, and size and beauty of cling-stone peaches and plums are well known. Heretofore, the trouble of pitting has been a serious objection to them for canning and drying. Now that this is overcome, there promises to be a revolution in orcharding and in the nursery business. Clings will be all the rage, and in demand at high prices.

Mr. Tarleton is a natural mechanic, and has invented and improved several useful implements before. This, we believe, is the first upon which he has applied for a patent. So struck were we with it at once, on seeing it work, that we exclaimed, "Mr. Tarleton, this little invention is worth more than your $40,000 orchard, although yours is the best in the State of its size."

LETTER-WRITING.

We receive a good many letters that puzzle us to find out from where or whom they come. Letter-writing is so simple that everyone should know how to do it so that nothing is left to guess at. If Mr. Poodue, of Poodueville, Hop-scotch county, Alaska, were to sit down, the 15th day of October, to write a letter, he should commence thus:

Poodueville, Hop-scotch Co., Alaska, October 15th, 1876.

Then, were he addressing the publishers of this journal, he should next say:

PUB. CAL. AGRICULTURIST:

And go on in a direct manner to say his say, as the business on hand may demand. After he gets through he should wind up with

Respectfully yours,

signing his name clearly in full,

HORATIO POODUE.

This will let the publishers know—1st where the letter comes from; 2d, the month, day and year it was written, 3d, who it is to; 4th, what it contains, and 5th, who the letter comes from—all of which are equally important in a business letter. Observe these five rules, count them on the five fingers of your right hand, and when you write, see that each rule is observed, and accept our thanks.

Remember the AGRICULTURIST office is now at 338 First street.

Poetry.

The Flood of Years.

BY WILLIAM CULLEN BRYANT.

Mighty Hand, from an exhaustless urn,
Pours forth the never ending flood of years
Among the nations. How the rushing waves
Bear all before them! On their foremost edge,
And there alone, is Life; the Present there
Tosses and foams and fills the air with roar
Of mingled noises. There are they who toil,
And they who strive, and they who feast, and they
Who hurry to and fro. The sturdy hind—
Woodman and deiver with the spade—are there,
And busy artizan beside his bench,
And pallid student with his written roll.
A moment on the mounting billow seen—
The flood sweeps over them and they are gone.
There groups of revelers, whose brows are twined
With roses, ride the topmost swell awhile,
And as they raise their flowing cups to touch
The clinking brim to brim, are whirled beneath
The waves and disappear. I hear the jar
Of beaten drums, and thunders that break forth
From cannon, where the advancing billow sends
Up to the sight their forces of armed men,
That hurry to the charge through flame and smoke,
The torrent bears them under, whelmed and hid,
Slayer and slain in heaps of bloody foam.
Down go the steed and rider, the plumed chief
Shinks with his followers; the head that wears
The imperial diadem goes down beside
The felon's with cropped ear and branded cheek.
A funeral train, the torches waving, the sad
Bearers and bier and mourners. By the bed
Of one who dies men gather sorrowing,
And women weep aloud; the flood rolls on;
The wail is stifled and the sobb up group
Borne under. Hark to that shrill sudden shout,
The cry of an applauding multitude
Swayed by some lond forensic orator who wields
The living mass as if he were its soul.
The waters choke the shout and all is still.
Lo, next a warring crowd and one who spreads
The hands in prayer; the engulfing wave o'ertakes
And swallows him and them. A sculptor wields
The chisel and the stricken marble grows
To beauty; at his easel, eager eyed,
A painter stands, the meaning of his touch,
Gathers upon the canvas, and life glows;
A poet, as he paces to and fro,
Murmurs his sounding lines, Awhile they ride
The advancing billow, till its fossing crest
Strikes them and flings them under while their taske
Are yet unfinished, See a mother smile
On her young babe that smiles to her again—
The torrent wrests it from her arms; she shrieks,
And weeps and tears her hair, and sinks down.
A beam like that of moonlight turns the spray
To glistening pearls; two lovers, hand in hand,
Rise on the billowy swell and fondly look
Into each other's eyes. The rushing flood
Flings them apart; the youth goes down; the maid,
With hands outstretched in vain and streaming eyes,
Waits for the next high wave to follow him.
An aged man succeeds; his bending form
Sinks slowly; mingling with the sullen stream
Gleam the white locks and then are seen no more.

Lo, wider grows the stream; a sea-like flood
Saps earth's walled cities, massive palaces
Crumble before it; fortresses and towers
Dissolve in the swift waters; populous realms
Swept by and disappear, their great and mighty tribes
Engulfed and lost, their very languages
Stifled and never to be uttered more.

I pause and turn my eyes and, looking back,
Where that tumultuous flood has passed, I see
The silent Ocean of the Past, a waste
Of watery wilderness, a gravare, its shores
Strewn with the wreck of fleets, where mast and hull
Drop away piecemeal; battlemented walls
Frown idly, green with moss, and temples stand
Unroofed, forsaken by the worshipers.
There lie memorial stones, whence time has gnawed
The graven legends, thrones of kings o'erturned,
The broken altars of forgotten gods,
Foundations of old cities and long streets
Where never fall of human foot is heard
Upon the desert pavement. I behold
Dim glimmerings of lost jewels far within
The sleeping waters, diamond, sardonyx,
Ruby and topaz, pearl and chrysolite,
Once glittering at the banquet on fair brows
That long ago were dust; and all around,
Strewn on the waters of that silent sea,
Are withering bridal wreaths, and glossy locks
Shorn from fair brows by loving hands, and scrolls
O'erwritten—haply with fond words of love
And vows of friendship—and fair pages flung
Fresh from the printer's engins. Where they lie
A moment and then sink away from sight.

I look, and the quick tears are in my eyes,
For I behold, in every one of these,
A blighted hope, a separate history
Of human sorrow, telling of dear ties
Suddenly broken, dreams of happiness
Dissolved in air, and happy days, too brief,
That sorrowfully ended, and I think
How painfully must the poor heart have beat
In bosoms without number, as the blow
Was struck that slew their hope or broke their peace.

Sadly I turn, and look before, where yet
The flood must pass, and I behold a mist
Where swam dissolving forms, the brood of Hope,
Divinely fair, that rest on banks of flowers
Or wander among rainbows, fading soon
And reappearing, haply giving place
To shapes of grisly aspect, such as Fear
Molds from the idle air; where serpents lift
The head to strike, and skeletons stretch forth
The bony arm in silence. Far her on
A belt of darkness seems to bar the way,
Long, low and distant, where the Life that Is
Touches the Life to Come. The Flood of Years
Rolls toward it, nearer and near. It must pass
That dismal barrier. What is there beyond?
Hear what the wise and good have said: Beyond
That belt of darkness still the years roll on
More gently, but with not less mighty sweep,
They gather up again and softly bear
All the sweet lives that were o'erwhelmed
And lost to sight—all that in them was good,
Noble, and truly great and worthy of love—
The lives of infants and ingenuous youths,
Sages and saintly women who have made
Their households happy—all are raised and borne
By that great current in its onward sweep.
Wandering and rippling with caressing waves
Around green islands, fragrant with the breath
Of flowers that never wither. So they pass,
From stage to stage along the shining course
Of that fair river to the ocean, life a sea,
As its smooth eddies curl along their way,
They bring old friends together; hands are clasped
In joy unspeakable; the mother's arms
Again are folded round the child she loved
And lost. Old sorrows are forgotten now,
Or but remembered to make sweet the hour
That overpays them; wounded hearts that bled
Or broke are healed forever. In the room
Of the grief-shadowed Present there shall be
A Present in whose reign no grief shall gnaw
The heart, and never shall a tender tie
Be broken—in whose reign the eternal Change
That waits on growth and action shall proceed
With everlasting Concord hand in hand.

Half-Way Doin's.

BY IRWIN RUSSELL.

Belubbed fellow trabellers: In holden' forth to-dey,
I doesn't quote no special verse for what I has to say,
Do serum will be berry short, an' dis here am de tex':
Dat half-way doin's sin't no 'count for dis worl' or de nex'.

Dis worl' dat we's a lubbin' in is like a cotton row,
Whar ebery culled gentleman has got his line to hoe;
And ebery time a lazy nigger stops to take his nap,
De grass keeps on a growin' for to smudder up his crap.

When Moses led de Jews acrost de waters ob de sea,
Dey had to keep a goin', jes as fas' as fas' could be;
Do you s'pose dat dey could eber hab succeeded in dcir wish,
And reached de Promised Land at last, if dey had stopped to fish?

My frien's, dar was a garden once whar Adam libbed wid Ebe,
Wid no one 'round to bodder dem, no neighbors for to thieve,
And ebery day was Christmas, and dey got deir rations free,
And eberyting belonged to dem except an apple 'tree.

You all know bout de story—how de snake come a stump-tail, rusty moccasin, a crawlin' on de groun'—
How Eve an' Adam eat de fruit, an' went an' hid deir face.
Till de angel oberseer he came an' drove 'em off de place.

Now, s'pose dat man an' 'ooman hadn't 'tempted for to shirk,
But had gone about der gardenin', and tended to deir work,
Dey wouldn't hab been losin' whar dey had no business to,
And de debbil nebber'd got a chance to tell 'em what to do.

No half-way doin's, brodren! It'll nebber do, I say,
Go at your task an' finish it, an' den's de time to play—
For eben if de crap is good, de rain'll spile de
Unless you keeps a pickin' in de garden of your souls.

Keep a plowin', an' a hoein', an' a scrapin' ob de rows,
And when de ginnin's ober you can pay up what you owes:
But if you quits a workin' ebery time de sun is hot,
De sheriff's gwyne to lebby on eberyting you's got.

Whateber 'tis you's dribin' at, be sure en' dribe it true,
An' don't let nuffin' stop you, but do what you's gwyne to do:
For when you see a nigger foolin' den, shore as you's born,
You's gwyne to see him come out ob de small end ob de horn.

I thanks for de 'tention you has gib dis afternoon—
Sister Williams will oblige ne by a raisin' ob a tune—
I see dat Brudder Johnson's 'bout to pass aroun' de hat,
And don't let's hab no half-way doin's when it comes to dat.

The Fogy Farmer.

A farmer lived in the Keystone State
On a hundred acres of soil,
He labored early and labored late,
And his hands were hard with toil.
He didn't believe in progress much,
And he thought t was very strange,
And said in his mind "it beats the Dutch"
That farmers join the Grange.

"For what's the use," said the fogy man,
"As I often tell my wife,
Hard work is better than any plan
To carry you through this life.
And a hundred tons of phosphate,
If you put it on the farm,
Won't do the good in this Keystone State
You can do with a single hand."

So he hardly took the time to dream,
And he filled his eyes with dust,
And he wouldn't thresh his grain by steam
"For fear the thing would bust."
So his neighbor Jones his wheat had sold,
In the nearest market town,
And turned his crop into solid gold,
Before he had his done.

And this fogy man, when he came to sell
In the quiet part of the fall,
Found the price of grain 'had fell,"
And got no price at all.
While Jones, the Granger, worked with brain
And not alone with hand,
At the sheriff's sale, came down the lane
And bought the whole of his land.

But he still thinks ignorance is bliss,
And says it's just his fate,
And never lays it all to this,
That he would not educate.
"He wasn't born with a silver spoon,"
And he says 'tis thundering strange,
And he hangs around a beer saloon,
But he hasn't joined the Grange.

Fraternity.

MRS. R. W. BRAINARD.

The farmer plows and the farmer sows—
The heat on the blacksmith's anvil glows,
While under the weight of his brawny hand
The plow is forged for the farmer's land.
Clasp hands! ye brothers in honest toil,
Ye sturdy sons of the mother soil!

The farmer reapeth the golden grain—
The miller weareth the creaking wain
That brings his share of the common toil,
And marks his rank with sons of the soil.
Clasp hands, ye brothers! a triple power
That gives the nation a farmer's dower.

The farmer clippeth the fleecy wool,
And plucks the bolls of cotton full,
The weaver bends to his noisy loom,
And piles the webs in the crowded room.
Clasp hands! ye brothers, in friendly zeal,
Ye hold, united, a nation's weal.

Ho! farmer, gathering fruit and grain—
Ho! merchant, counting your loss and gain—
Ho! builder, modeling wood and stone—
Ho! sailor, reaching from zone to zone—
Clasp friendly hands! for a common toil
Binds all mankind to the mother soil.

—Son of the Soil.

An abundant harvest, and imploring printer.

Poultry Yard.

A FEW HINTS ON POULTRY.

POULTRY keeping in California is often attended with much vexatious loss and trouble. During the summer the hens get terribly lousy and covered with fleas, if not carefully attended to. Frequently they get diseased and die off strangely.

On most farms, where a few dozen poultry are kept, the fowls have no special houses or roosting places, but scatter around upon scaffolds in the barn, upon the partitions of horse stalls, upon piles of rubbish, fences, branches of trees, or wherever they can find a place to perch. If they get diseased or lousy it is almost impossible to get at them, or their roosting places to correct the evil. In fact, they are kept as a sort of tolerated nuisance, and are allowed to shift mostly for themselves; are plentifully fed when they can get it from the stack, and go hungry when they cannot find enough to eat. If all circumstances happen to be favorable, and the fowls do well—that is, lay well and raise a lot of nice chickens from nest stolen away—why, well and good, chickens are profitable to keep. But if, on the contrary, as most frequently happens, they do not lay well, only hatch out a few scattering chickens, and get sick and die off, why, somebody has no luck with chickens, and it don't pay to bother with them.

Now, there is no effect without a cause, and this simple admitted assertion will as well apply to the chicken business as to any other. There is a reason why chickens get lousy, diseased, poor and worthless on one place and do finely on another. It is not always in the soil, atmosphere, nor locality. It is certainly owing to favorable or adverse conditions. Care and proper treatment will obviate any difficulty of location, but the most favorable location will not make all right under indifferent circumstances.

The experience of poultry raisers for many years have proved some things, and sufficient reliable data can be found on which to predicate some sound advice.

Chickens and other fowls should have pure air to breathe. At night this cannot be obtained in a privy, pig-sty nor closely over the filthy accumulated droppings of months, under a shed. They should not be exposed to the full draft of wind and to storms, but better this than bad air. Their roosts should be kept clear of vermin by frequent washing with kerosene, soap suds, tobacco, and lime wash, or something that will destroy lice and prevent a deposit of vermin eggs, on the roosts. A clean, open house that can be kept clean is the best, although evergreen trees make good roosting places. The nest boxes should be kept clean, and be supplied with clean straw, and sprinkled with sulphur.

An open range is desirable when convenient, but fowls may be kept in close quarters if kept clean and allowed good wallowing dust beds. Clean, pure water should be supplied in quantity for drinking. Much depends upon this. Many chickens get diseased upon impure water. One cannot be too particular about clean water for fowls.

When it comes to feeding, a good deal can be said. Above all, clean food should be supplied, and foul, decaying substances, of animal matter particularly, should not be put within their reach. Fowls are fond of meat, insects, etc., and should have such food. Wheat is pro-

bably the best single grain for chicken feed, but a variety is better than any one kind of feed. If chickens have all the wheat they want and a variety of other grains to pick at, they can best select what they want and need. Milk is an excellent feed, and should always be given when one has it to give. Wheat bran mixed in milk is an admirable side dish for poultry, to be set where they can get at it continually,

We wish to call particular attention to the necessity of supplying green feed of some kind to poultry. In our climate, where, at this season, but little green is to be seen without irrigation, many lots of poultry are without green feed of any kind for months together. This is one leading cause of ill success. Poultry should have green feed the year round, and must have it, too, or some substitute, or they will surely suffer. They are great grass-eaters, and must have some succulent feed to keep healthy. Hens are scratchers and should have some place to scratch, and something to scratch for. At this season, on most places, the ground is hard and unyielding. It should be plowed and harrowed up to encourage the chickens to scratch and wallow in the dirt. If the wheat for feed is sown thickly and harrowed in so that they will have to scratch to find it, it will give the fowls employment and healthy exercise.

Much more might be said upon this subject. But a few rules observed, a thorough system pursued, and common sense and good care used, will in every case pay in rearing poultry on the farm.

HATCHING CHICKENS.

The best season in which to raise broods of fine, healthy fowls is in the fall of the year, in California. The cool, moist weather when the rainy season commences seems to be much more conducive to health of young fowls than the warmer and dryer season. Thousands of seeds are sprouted with the rains, the soil is softened, and there is better picking and scratching for them, something tender and green to pick up, and little annoyance from chicken lice at this season when nights are frosty.

Of course, shelter should be provided for young fowls, so that they can keep dry during storms in winter. But they should be allowed as much liberty, when large enough to scratch as the range will admit. Pullets raised from eggs set this month will be ready to lay in early summer, and when poultry is a good price the roosters can be disposed of to best advantage.

February is also a good month to sit eggs and hatch out chickens. As soon as hot weather commences, the hatching of chicks should cease for the season.

Fowls that are moulting, as most old birds are, just at this time, are of course unfit for marketing. This fact is not generally appreciated. But the moulting process is a species of skin disease, with domestic poultry; that is to say, during the weeks that the old plumage is dropping away, and the time that the new feathering is forming, the fowl's flesh is in a fevered condition, in consequence of the death and slow departure of the previous year's coating.

At such a period, the older fowls are quite unfit for the table, though thousands of such birds are kept by their owners up to this natural change in the fowl's life—which succeeds the laying of their annual litter of eggs, usually—and are then killed off, because they are commonly at such time in good condition apparently.

If these older birds are to be slaughtered at all, they should be killed before the moult commences, or they should be kept over to cold weather, or until their new feathering is fully out. This may be decided upon by taking your fowls from the roost at night, and examining the skin. If the body is covered with blue-shafted "pin-feathers," such birds ought to be kept till November or December before killing. If these pin-feathers have not yet begun to show themselves, then the bird may be properly used for marketing.

With fall chickens, the case is somewhat different, though it is dependent upon their age. Usually, by October the spring chicks' first moult is completed, and the pin-feathering is *non est* upon their bodies. But, in either case, if there be a show of this, upon examination, birds should not be killed, for eating. These pin-feathers may be scalded off, or picked out, through careful plucking. But no one who knows anything about the above facts will ever choose a chicken in market whose skin is covered with these offensive bine, dead-blood-filled feather-shafts, and no poultryman should ever kill a bird to offer for eating, young or old, that is going through its moult.—*Fancier's Journal.*

Raising Turkeys.—The most successful turkey raisers feed the chicks for the first few days of their lives upon finely chopped, hard-boiled eggs, and keep them from wandering off by cooping up the hen. After the chicks are a week old, scalded wheat, or oaten grits and cornmeal may be given, but until they are fully fledged, they should be carefully protected from rain storms and wet grass.

Domestic.

Woman's Work.

BY ANNIE HALLS.

To wash and bake, to mend and make,
The weary steps of toil to take;
To cook and scour, to dust and sweep,
And all the house in order keep.
To rise at morn and o'er and o'er
Do duties done the day before,
And know that in to-morrow's train
The same things will come o'er again,
And often to herself to say,
The old, old lines in weary way,
"From dawn of day till setting sun
Woman's work is never done."

To watch and pray, to gladly take
Love's crosses for love's crowning sake,
To love and grieve, to smile and weep;
Her deepest thought in silence keep.
To teach and lead, to hope and trust,
Have trust betrayed—a woman must.
To gently chide, to cheer and bless,
And bear with patient tenderness
Her burdens all; nor shrink away,
But bravely look ahead and say,
"From dawn of life to setting sun,
Woman's work is never done."

Preserving and Keeping Tomatoes.

Mrs. Roma W. Woods, in the *Western Farm Journal*, says:

The first and most important thing to remember is this: that all fruits which mature quickly, as rapidly decay; they simply reach perfection, and at once begin to die, and when decay has once commenced it cannot be permanently arrested. So I use under-ripe rather than over-ripe tomatoes. If they are free from soil or other dirt, they will not need washing before scalding. As you take the skin from each, slice it twice, and drop into your porcelain kettle. When nearly full pin a piece of mosquito netting over it, and put the kettle over the fire; stir frequently with a silver spoon or hard wood paddle, and when you are sure that the mass has all boiled, dip it out into your glass cans, which should be standing on several thickness of cloth, folded smooth, which has been wet in cold water; pour the hot water out of the cans, and fill nearly full. Leave them on the cloth and open, until you can hold your hand upon the side of the cans. Put on the rubbers, fill one can full of boiling water or boiling tomato juice, and put the top on, and screw it tight; and so on until your cans are sealed. Wipe each can thoroughly, first with a damp cloth, then with a dry cloth, and put them in a dark place until the next day. If they are perfectly dry you may put them away in a dark, cool place, and in winter keep glass cans where they will not freeze.

In preparing for the table (do not use iron or anything with the tin worn off to cook them in), season with salt, pepper, butter and white sugar; and when they boil up once, remove from the fire and dish them; too much boiling extracts the bitter principle in the seeds—standing in tin will also make them dark and bitter.

To make washing days more endurable on the farm, and less wearying to the female portion of the family, one of the men-folks should see to it, every Monday morning, that wood and water are provided in abundance. If the clothes can be collected the day before and put to soak, either in warm or cold water, all the better. Half the merit of the new soaps and washing powders which are continually being brought forward, and urged upon our attention as labor-savers, is due to the observance of the "rules and directions" which usually accompany them.

A fault of many economical housekeepers shows itself in the small quantity of soap used for washing clothes. It is both easier and cheaper, in the long run, to dissolve the dirt by the free use of soap, rather than attempt to rub it out by friction between the washboard and the hands. Bed clothes and many others may often be thoroughly washed by simply boiling them in soap suds, and then rinsing in clear water. Cold soap suds will dissolve much dirt, but hot soap suds will remove much more.

Moths.—Moths will work in carpets in rooms that are kept warm in the winter as well as in the summer. A sure method of removing the pests is to pour strong alum water on the floor to the distance of half a yard around the edges before laying the carpets. Then once or twice during the season sprinkle dry salt over the carpet before sweeping. Insects do not like salt, and sufficient adheres to the carpet to prevent their alighting upon it.

Rules for Action in Cases of Accident.—Professor Wilder, of Cornell University, gives these short rules:

For dust in the eyes, avoid rubbing; dash cold water in them, remove cinders, etc., with the round point of a lead pencil.

Remove insects from the ear by tepid water; never put a hard instrument into the ear.

If an artery is cut, compress it above the wound; if a vein is cut, compress it below.

If you are choked, go on all fours and cough.

For slight burns, dip the part in cold water; if the skin is destroyed, cover it with varnish.

For apoplexy raise the head and body; for fainting, lay the person flat.

Squash Pancakes.—Having some cold boiled squash left over one day, mother thought to experiment; so she mixed with it, after thoroughly rubbing all lumps out, 2 eggs, salt, a little baking powder, sweet milk and flour enough to make a stiff batter, and fried it on the griddle. They were delicious, and now squash pancakes are a regular dish at our house. They are light as feathers. —*Cor. Rural World.*

No meal should be considered complete without fruits. Laboring men are apt to consider them more as matters of taste and ornament than of use or nutriment. Often, in our ordinary eating, they are the one most important item lacking, and needed to keep the system in easy working order. I know it is not an easy matter to have fruits in much variety in early summer, unless we can draw on the last year's supply. The latter, however, we ought to be able to do, and now is the time to make the desired arrangements for another season.

Mr. Wm. Emerson Baker, a Massachusetts gentleman, who is described as an "eccentric millionaire," has turned over to ex-Gov. Gaston and four other trustees, a farm containing fifty acres of land, and added $56,000 in money for the purpose of founding a school of cookery. May it prove a success.

To make apple-tea, pour boiling water over roasted sour apples, and let them stand until the water is cold. This is a very palatable drink for invalids.

The Angora Goat.

An average quality of Angora fleece realizes, according to the fluctuations of the market, from 70 to 80 cents a pound. Pure Angora of the finest quality can be sold for a dollar. An average fleece will weigh from four and one-half to five five pounds, thus realizing from two to three times the present value of an ordinary sheep. The first cross with the common goat will pay to shear. The fleece of the third cross sells at 60 cents. A fourth cross fleece fetches from 70 to 80, and after that there is no difference from pure bloods. England imports 7,000,000 pounds annually, and mohair goods are in demand. When the business has proved a failure it has been for want of proper attention, or because the location is unsuitable. All animals valuable for fleece thrive best upon succulent food. Hence Angoras have proved profitable in all parts of Oregon where grass can be had the year round. The mountain counties of California are suited for the business because succulent food is there abundant in the fall. Snow does not hurt Angoras, although rain and sleet proves injurious. Those persons in Nevada who have engaged in the business have proved it profitable, and they have proved that Angoras will live through a hard winter upon browse, which is usually obtainable, notwithstanding there may be 10 or 12 inches of snow on the ground. California produced 30,000 pounds of Angora fleece last year, and this year's clip is estimated at 10,000 pounds more. H. H. Farr & Co, of the Holyoke Mills, Mass., and Hall & Turner, of Princeton, New Jersey, are ready to purchase all the mohair California can supply. Besides the fleece, Angoras are valuable for their pelts, which, when died, make admirable buggy robes.—*Cor. S. F. Bulletin.*

Horticulture.

CULTIVATION OF COFFEE IN MEXICO.

BY HON. JOHN W. FOSTER, UNITED STATES MINISTER TO MEPICO.

THE total product of the coffee crop of the world for 1874 is estimated at about 900,000,000 pounds,* of which amount the United States imported in 1875 one-third, or 317,970,665 pounds; which fact is sufficient to indicate the great interest which this country has in its production and cost. The chief coffee-producing countries are Brazil (whose product is about two-thirds of the entire amount), the Dutch colonies, the West Indies, the Central and South American republics, and Ceylon. Coffee was first introduced into Europe more than two hundred years ago, but during the last fifty its use has greatly increased, and of recent years the supply has not kept pace with the growing demand in the civilized world. In the United States the amount imported twenty years ago, in 1856, was 235,865,268 pounds, of the value of $21,573,558. In 1875 the amount imported was 317,970,665 pounds of the value of $50,591,488. But as the consumption is affected somewhat from year to year by the production, it is fair to estimate the average importation. The three years beginning with 1856 show an average annual importation of 221,800,000 pounds, of the value of $20,700,000; and the three years ending with 1875 an average annual importation of 298,700,000 pounds, of the value of $50,000,000. It will thus be seen that in the past 20 years the increase in quantity of imports of coffee has been only 34 per cent., which is 21 per cent. less than the increase of population, but that the increase in value has been 146 per cent. It will be interesting to make a comparison with the importations of the other table beverage, tea. The increased amount of importations in pounds (annual average) of tea from 1856 to 1875, inclusive, has been 136 per cent. or 81 per cent. more than the increase of population, the latter being in the past twenty years 55 per cent. The import consumption of coffee and tea per inhabitant, estimating the population in 1856 at 27,000,000 and in 1875 at 42,000,000, was as follows:

	1856. POUNDS.	1875. POUNDS.	PER CENT.
Coffee	8.24	7.11	Decrease of 13
Tea	.93	1.42	Increase of 54

Comparing the consumption of coffee and tea with the population, it is thus seen that the increased consumption of coffee has fallen behind the increased population, while that of tea has very largely exceeded the growth of the country, and that there is actually less coffee used per capita than twenty years ago. The reason of this is not found in the decreased popularity of coffee as a beverage as it holds a place in the taste of the American people much above tea; but the explanation is justly to be attributed to

THE GROWING DEMAND FOR COFFEE THROUGH THE WORLD,

and the failure of the production to keep pace with that demand, which has greatly enhanced the price. The price in gold of tea at wholesale is to-day as low as it was in 1860, before the civil war,† while coffee is nearly double the price of 1856 and 1860. These statistics are given to show that the United States are deeply interested in the increased production of coffee, and in finding new and more accessible sources for its supply of this article, of which it is a much larger consumer than any other nation in the world. It may be an unknown fact to many Americans that at our very doors, in Mexico, our neighboring republic, there exists the agricultural capacity to produce all the coffee that can be consumed in the United States, and of quality equal to the best grown in any country. Mexico, it is true, is exporting very little coffee, and scarcely figures in the coffee-producing countries, but its capacity and adaptability for its production have been tested by more than fifty years of successful cultivation. The topographical and climatic character of the country is admirably adapted for this purpose.

THE COFFEE-PRODUCING REGIONS,

The great Andean mountain range coming up through South and Central America, greatly depressed in the Isthmus of Tehuantepec, apparently for the passage of the commerce of the two oceans, suddenly springs up in Southeastern Mexico into lofty cordilleras, one branch of which follows close along the Pacific and the other along the Gulf coast of the country, holding up on these two arms the great table-land of the interior, thus affording every variety of production of the earth. The coffee-producing regions are found on the entire line of sea-slope of the mountains from Guatemala on the south, on the Pacific side, for more than a thousand miles to the north, until it reaches a line in the State of Sinaloa where

OCCASIONAL FROSTS ENDANGER THE CROP;

and also for more than a thousand miles on the Gulf coast from Yucatan into Tamaulipas. In addition to these immense stretches of country it flourishes in the numerous and fertile valleys of the interior, wherever the great table land is sufficiently depressed to reach the level of tropical and semi-tropical vegetation. The elevation above the sea at which it is thought coffee is most favorably grown is from 1,000 to 4,000 feet; but in Mexico it is cultivated with success at an elevation of 4,500 feet, and it is even found still higher. So also it is grown at lower levels than 1,000 feet, as in various places in Mexico it is produced at the very sea-side. Off the eastern coast of Yucatan, on the island of Cozumel, coffee trees of prolific yield are growing nearly at the sea-level as well as in many other localities on both the Pacific and Gulf coasts. So that it will be seen that the area for cultivation of coffee in Mexico is immense. The amount of its production, so far as natural capacity is concerned, need only be limited by the extent of land brought under cultivation. As already stated, the adaptability of Mexico as a coffee-producing country has been tested by

MORE THAN FIFTY YEARS OF EXPERIENCE

in its cultivation, which experience proves that in profit to the producer, as well as in quality of the article, this country has no superior. That it has not assumed the first place in exportation is to be attributed to other causes than the capacity of the soil, profit of the cultivation, or quality of the article—to the same causes which have retarded all commercial and agricultural development of the country. In 1818 and 1819 the profitableness of the growth of coffee in the West Indies led to the establishment of extensive plantations in the vicinity of Cordova and Orizaba, and in 1825 they were in a flourishing state. In the valleys of Cuernavaca and Cuautla, in the interior, in 1826, there were estates where there were growing as many as five hundred thousand plants.* And elsewhere in the republic much attention was given to coffee planting at that period, and great hopes were entertained that the country would soon be largely engaged in its exportation to foreign countries. But the civil disorders, which began soon after and which continued till lately, paralyzed all business enterprises, and disappointed these hopes; so that the coffee production of Mexico has been mostly limited to supplying the home demand, which is quite large as coffee is in very general use by all classes. During the past few years, up to the close of 1875, there have been peace and security in the country, and the cultivation of coffee has begun to increase, so that a small exportation has commenced. The statistics of the single port of Vera Cruz will show the growth of this exportation, which although insignificant as compared with the total production of the world, still indicates a very healthy development of this industry; it ought in a few years to become very considerable:

EXPORTATION OF COFFEE FROM VERA CRUZ.

Year ending June 30, 1871	672,588 lbs
Year ending June 30, 1872	1,942,220 lbs
Year ending June 30, 1873	3,909,446 lbs
Year ending June 30, 1874	4,204,446 lbs
Year ending June 30, 1875	5,373,678 lbs

The coffee exported from Vera Cruz is all grown in that State, with the valley of Cordova, on the Mexico and Vera Cruz Railway, as the chief center of its production. A brief reference to

THE METHODS OF ITS CULTIVATION AT CORDOVA

may be a matter of interest to the vast number of coffee-drinkers in the United States, many of whom know nothing of the article except at the daily breakfast table.† The seed or grain, which should be selected with care, is usually planted in well-prepared beds in a nursery, shaded from the sun. The young plants are transplanted at the age of one year or eighteen months to the fields or *cafetales*, which are thoroughly cleaned of all under-growth and the soil well prepared. As the young plants are very tender, it is necessary to protect them from the sun. For this reason open forests are used, where available, and the mountain sides affording shade are utilized for coffee plantations. In open fields a growing shade must be created, which is most quickly obtained by planting banana trees, also yielding some profit from their fruit. But the best cultivators at Cordova consider this a poor substitute. One of the most intelligent planters there has set out in his coffee fields a large number of cinchona trees (from which quinine is made), which grow well in that latitude; also valuable timber trees, as the oak, walnut, etc. The second year after planting there is a very slight yield of coffee; the third year about a half crop; and the fourth year (or when the plant is five years old) a full crop is gathered.

A REASONABLY RICH SOIL IS DESIRABLE FOR COFFEE,

and mauuring pays well in the vigor of the tree and increase of yield. The distance at which plants are set out in the field is usually about three yards (or varas) apart each way, although often planted closer. The cultivation consists in keeping the fields clean from weeds and undergrowth and plowing the soil. In certain localities irrigation is necessary, but in Cordova, after the plants are well started in the field this is not required, and the better class of planters give careful attention to pruning, keeping the plant or tree at the hight of from six to eight feet, although if unchecked it will grow to double that hight. The trees do not yield their full blossoming at one time. The first flowering is sometimes as early as December, the second about February, and the third and most abundant the last of March and the month of April. Early in April last it was my good fortune to spend several days in Cordova, in the midst of the blossoming season. The suburbs of the city in all directions are devoted to coffee cultivation. The lanes, lined on each side with *cafetales*, presented a most agreeable sight. The pure white blossoms, clinging close along the branches half covered with bright green leaves, gave the trees the appearance of being sprinkled with snow, and the perfume of the flowers, almost equal to that of orange blossoms, loaded the air with its fragrance. The flower falls, leaving a round green berry, which ripens in seven or eight months, changing when ripe into a red color. Each fully formed berry contains two grains, though sometimes it contains only one grain, which is sounded or oval-shaped, called by the Mexicans *caracolillo*. On account of the different times of flowering,

THE PICKING OR GATHERING SEASON

lasts for three or four months, each tree having to be carefully gone over three or four times by hand. This is the most tedious and difficult process of the whole cultivation. It cannot be postponed, must be done carefully, and requires an extra number of laborers, but women and children can be employed at low wages. The first process after picking is to dry the berries, which is done by exposing them to the sun, when they shrivel and change to a black color. They are then put into a mortar, and the grains hulled or beaten out with a pestle. The crude process of fanning it out by hand or winnowing, though sometimes a fan-mill is used. The coffee is afterwards picked over carefully, grain by grain, by hand, and selected, and it is then ready for sacking and the market. Up to the present the "doctoring" process of artificial coloring or bleaching, as in some countries, has been resorted to here.

THE PROCESS OF CURING

after gathering the crop, is in a most primitive state in Mexico. It presents a fertile field for Yankee ingenuity to invent instruments and methods to facilitate the process, or for enterprise to avail the inventions in use in other countries. And although it has been grown here for so many years, the coffee cultivation in Mexico may yet be considered in its infancy, as it is only beginning to receive the attention of intelligent and scientific cultivators, so that great improvements may be anticipated both in the cultivation and curing. Experience has, however, proved that it is

A CERTAIN AND RELIEBLE CROP.

So far its cultivation at Cordova has developed no disease of plant or berry. Insects do not attack it. It is very little affected by the climate, as in the locality of its production there is no frost; and although great drouth may diminish the crop, it does not destroy it. The flower, when in full bloom, is sometimes broken off by severe winds, but this seldom diminishes the yield. The crop is also clean and comparatively easy to cultivate. After the *cafetal* is once in full bloom the cultivation is easy. Only at the picking season is there much urgency required. Once gathered the crop can be

*American Grocer, September 26, 1875.

†New York Post, March 29, 1876.

*See Ward's Mexico, Book I.

†Hon. Martine Romero, well known in the United States as the former Mexican minister at Washington, has recently written a valuable work in Spanish, on coffee cultivation, entitled "Cultivo del cafe en la Costa Meridional de Chiapas."

cured and prepared for market leisurely and at the planter's convenience. The most prominent objection is that so much time is lost before a profit begins to be realized. If a planter commences with sowing the seed he must wait more than five years before he obtains returns upon his investment, or four years if he plants from the nursery, as the first year's crop barely pays more than the cost of cultivation and curing. But as compensation for this, a plantation once established yields a never-failing crop, without renewal, anxiety, or uncertainty for a lifetime.

THE PROFIT IN MEXICO

during the past few years has been about 100 per cent. over the cost of cultivation, and 10 per cent. interest on the capital invested. The period the trees will continue bearing as variously estimated is from twenty to twenty-five years. There are, however, trees now growing in Cordova sixty or seventy years old, remains of neglected and abandoned plantations, which by pruning and cultivation are yielding a fine crop. An intelligent American planter in that valley claims that with attention and care plants ought to continue bearing vigorously for fifty years. Another important feature of coffee-planting in Mexico is that the locality of its cultivation is usually both healthful and attractive—elevated above the fatal diseases of the tropics and in the presence of the most beautiful scenery. The valley of Cordova, for instance, is among the foot-hills of the great mountain of Orizaba, whose peak is covered with eternal snow, in a rich semi-tropical vegetation, and with a remarkably equable climate, the elevation being 3,000 feet above the sea.

THE AVERAGE YIELD PER TREE

at Cordova is estimated at about one and a half pounds, although it is claimed that with intelligent culture, pruning, and manuring, the average yield in that valley may be increased to three pounds per tree. It is not uncommon to find trees yielding from five to seven pounds, and in very exceptional cases, from twenty-five to fifty pounds each. With the trees planted nine yards apart each way, with the above-stated average, it is easy to estimate the yield per acre. It is unsafe to give a detailed calculation of the outlay required in establishing a plantation or *cafetal* up to the time of yielding the first paying crop, as much depends both upon the locality, and the intelligence and the economy of the planter, so that published estimates are apt to mislead. It may be stated, however, that after the plants begin to bear a full crop, the cost of annual cultivation is pto sale in local market, is from 6 to 7 cents a pound. It is very difficult to give any definite idea of

THE PRICE OF LAND IN THE COFFEE-GROWING REGIONS.

The average price, as per sales which have been made in the valley of Cordova beyond the vicinity of the city during the past two years, has been about $10 per acre, and at points out of the reach of the railroad, in the same State of Vera Cruz, sales have been made at $5 per acre, or even less. But this has been in a time of great business depression, and with a revival of commerce, and a growing demand for coffee lands, the price would very soon advance, possibly 50 or 100 per cent. In what has preceded I have referred particularly to the coffee region having the valley of Cordova for its center, for the reason that it is the locality at present of the greatest production in the republic, and is most accessible to the American market. But there are several other localities in the country where the cultivation is receiving considerable attention, and is assuming some importance in exportation. One of these localities is

THE DISTRICT OF SOCONUSCO,

in the State of Chiapas, immediately upon the borders of the republic of Guatemala. Hon. Matias Romero owns a plantation in that district, and the recent revival of this industry there is almost entirely due to his encouragement. Several Americans, and other foreigners, have located there, and are engaged in planting, and quite a number of the resident proprietors have embarked extensively in this cultivation. Among the special advantages presented in this district is the cheapness of land and labor. Public or Government lands, which are subject to entry by foreigners, can be taken at from $20 to $25 per *caballeria* (a Spanish measure of about 105 acres). Private lands have been sold at from $50 to $100 per *caballeria*, but native landowners here, as elsewhere in Mexico, have little disposition to part with their estates. Continued success in coffee-culture and a growing demand will materially increase the price. Wages are reported at 25 cents per hand per day; but, of course, this very low price could not be continued with a greatly increased demand for labor. The chief impediment to the development of this industry in Soconusco is the fact that this district is a disputed territory, claimed by both Mexico and Guatemala, and until this vexed question is settled, the tenure and protection of property will remain insecure. The valley of Urnapan, in the State of Michoacan, has great celebrity for its fertility, and for the superior quality of the coffee grown there. But the most noted region, especially for the excellence of its coffee, is

THE STATE OF COLIMA, ON THE PACIFIC COAST,

its products being so highly esteemed that it commands a fabulous price in the city of Mexico, and more distant places of the republic. The planting of coffee began in Colima, in 1858, to a very limited extent, with plants obtained from Costa Rico. The article produced was found so superior to any other grown in the country—sample lots sent to private parties in Europe being pronounced equal to Mocha—that in 1873 quite an impetus was given to the cultivation, and since that year over one million plants have been set out, which are now beginning to bear, and the planting continues to increase—coffee promising to become the principal article of export, and a fertile source of wealth to the State. The demand for all thus far produced is so great that it commands, in large lots, 27 cents per pound at the plantation, mainly for consumption in the interior, a small portion only being shipped to Germany by the resident German merchants on private orders. The American Consul at the city of Colima places the cost of land, suitable for coffee plantations, including water for irrigation, at from $15 to $30 per acre—depending on location and climate. He states that a plantation, containing 100,000 plants four years old (when the first crop is realized) costs from $10,000 to $14,000—the proceeds the first year being about 50,000 pounds, and from the fifth year onward 100,000 pounds or upward; and he estimates the average net yearly gain at $20,000. Colima and some other states have passed quite liberal laws for the encouragement of coffee cultivation, offering liberal premiums for the largest crops produced, and exempting coffee lands from all taxes. With peace in the country, and protection assured, this industry would offer

GREAT ATTRACTIONS FOR FOREIGN IMMIGRATION AND CAPITAL;

and for the Mexican farmer and landowner there is no more certain or profitable enterprise in which they can engage. To the common people, the poor, the Indian race, it presents the most desirable source of industry. It can be planted in small lots, garden plots or patches. It requires no costly machinery, like sugar, to prepare it for market. Women and children can attend to the greater part of the work. It is always reliable, and commands a ready sale, for cash, at good prices. It will be a happy augury for the country to see the lower and laboring classes more generally engaged in its production, as it will give them a permanent property interest for peace and against revolutions, and will be for them and the country a most fertile source of wealth. Mexico, for three centuries past, has been famous for its great production and exportation of silver But, in coffee alone, it possesses a far greater source of wealth and prosperity. Its natural capacity for its production is at least equal to that of Brazil, yet the value of the coffee annually exported from Brazil is more than three times as great as that of the silver and gold product of Mexico.

OVER-PRODUCTION VS. INABILITY TO CONSUME.

A Few Facts Worth Considering.

For many months, says the *Inter Ocean*, a persistent yet utterly false outcry has come from a portion of the press of the country, particularly from newspapers of free trade proclivities, that the long-continued disorganization of industry and trade is attributable to over-production. As proof, we are pointed to warehouses crowded with goods which cannot find purchasers; to manufacturing establishments running on part time, with a reduced force of working people; and to the multitude of laborers who cannot find employment. Still, we do not see how these facts support the argument, because the use made of them necessarily implies a direct and emphatic contradiction of a universally admitted postulate of political economy—of a fundamental proposition admitted equally by all the different schools of the science—that *production is the only source of wealth.* The allegation that we are growing poorer by producing too much is to us an insoluble paradox; for it sounds very much like a man claiming that he is involved in serious pecuniary embarrassments because he has cleared too much money. The greater the quantity of things produced in the United states, the greater must be the aggregate of wealth. When the results of the census of 1870 had been declared, the figures were received with pride and exultation, as showing signal progress in the accumulation of property through the activities of production, and as indicating a more rapid increase of wealth than in the previous decade, notwithstanding the vast waste and destruction of both values and lives during a protracted and great civil war. It now seems to be in order among a certain class of people to deplore such a movement of the productive forces, accelerated in pace, as a misfortune, and as the true source of the existing stagnation of business in this country. Such a position is extravagantly nonsensical. Nothing should be plainer than that over-production cannot take place so long as human wants for the things produced remain unsatisfied, and that each persons share in the general work of production supplies him with the means of gratifying his needs or his desires. Are the masses of our people to-day so fully furnished with these articles of convenience, comfort, or luxury of which it is said there is an over-production, that they feel no lack? Unless this be so, there must be under-consumption, not over-production. If there are hundreds of thousands of individuals who would like to own a piano, or a sewing machine, or a new suit of clothes, or what not, but cannot afford the purchase because they have lost employment and wages, or because the profits of business have fallen off, then the glut is only seeming, not real.

In 1872, when there was a great abundance of all things, very much greater than now, and production was exceedingly active, there was not any complaint of an overwhelming surplus. What is now the matter is under-consumption Some 2,000,000 men and women are compulsorily idle, who then were regularly employed. The earnings of these people amounted probably, as a total, to $5,000,000 a day, or to $1,600,000 a year. This purchasing power, vast in the aggregate, has disappeared from the marts of trade, depriving of a market a vast quantity of articles that otherwise would have been purchased and consumed. Production itself declines because of this expensive failure of demand. Restore the lost purchasing power, in the shape of wages paid for daily work, then what is unreasonably styled over-production would vanish. For a while, what would need to be termed under-production would supersede the so-called over-production. If all the idle laborers could be set at work, and kept at work, the industrial movement would soon get safely on its legs to stay there, and thrift with contentment would once more visit a stricken land. The rapid circulation of commodities, attainable only through steadily employed labor at good wages, constitutes the material prosperity of our national life. Meantime, enough things are not produced to satisfy the wants of the people. There are more mouths to be fed, more backs to be clothed, more feet to be shod, more heads to be sheltered, more bodies to be warmed, and more minds to be instructed, in 1876, than there were in 1872; yet the quantity of things produced is smaller. The over-production is apparent, not real—constructive, not actual—a ratio between production and the crippled power to consume, not between production and the urgent needs of consumers.

OVER-PRODUCTION OF BOYS.

The Napa *Register* makes the following hit:

The most common explanation of the prevailing hard times is, "over-production." The market is said to be glutted with goods, and the manufactories more numerous and of greater capacity than the demand warrants: which of course makes the investments unremunerative, and produces hard times, as a natural result. The vineyardists and orchardists of California are in a dilemma similar to the one which is vexing the Eastern manufacturers. They are producing more fruit than they can sell profitably, and the effect is unpleasant. The hoodlum nuisance is explained and in a measure excused, on the ground that there is not work enough for the boys to do, and hence they run at large, and give Satan a chance to find something for their idle hands to do. Now, if dull times and hard times have been caused by over-production, as so many assert, i would only make the times all the hard

er by setting the boys at work in manufactories and upon farms; and the correct way of stating the hoodlum case is not that there is too little work for the boys, but too many boys for the work—a clear case of "over-production" all around.

THE SQUIRREL LAW.

We give space to the entire bill providing for the extermination of squirrels, as it is a matter of interest to every farmer, whether residing in the counties included or not. The principle of the law is correct, and we hope it will be strictly enforced:

Section 1.—Squirrels infesting lands in Stanislaus, Santa Cruz, San Joaquin, Merced, Fresno, San Benito, Tulare, San Mateo, Santa Clara, Monterey and Kern Counties, are hereby declared a public nuisance.

Sec. 2.—It shall be the duty of every person owning, claiming or occupying land within three miles of any cultivated field situate in those counties, to keep the land so owned, claimed or occupied, clear of squirrels, and to destroy in such duty shall be entitled a sufficient cause for the public, through its authorized agents, to enter upon such land and abate the nuisance by destroying the squirrels thereon as in this Act provided; and all costs and expenses incurred, as in this Act provided, are hereby declared a lien upon and against all the lands so owned, claimed or occupied, upon which said expenses are incurred, and such lien shall not be removed until payment or sale has been made to satisfy such costs and expense

Sec. 3.—The Board of Supervisors may, in their discretion, create Squirrel Inspection Districts, composed of one or more School Districts, and may, in their discretion, appoint one suitable person in each of the said districts, not exceeding in Squirrel Inspector. Said Board shall be governed, as far as practicable, by the recommendation of the trustees of the district in making such appointments by the recommendation of the land owners, claimants and occupants of land in said districts. The appointee shall qualify with the usual oath of office and such bond as the Board of Supervisors may require, and hold office at the pleasure of the said Board of Supervisors. The Board of Supervisors may fill any vacancy that may occur from any cause in the said office, and the said inspector shall be held responsible to the owners or occupants for any unreasonable or unnecessary damage that may occur in carrying upon lands for the purpose of destroying squirrels.

Sec. 4.—Each of said inspectors shall be entitled to compensation at the rate of $3 per day for actual service, to be paid as hereinafter provided.

Sec. 5.—Each squirrel district inspector provided for by this Act shall upon request of any land owner give needful instruction in the use of poison, or implements for the destruction of squirrels, to land owners, claimants and occupants of land in his district.

Sec. 6.—On the first Monday of October in each year, unless some other day is fixed by the order of the Board of Supervisors, the land owners, claimants and occupants of land in each squirrel inspection district provided for by this Act, shall commence destroying the squirrels on all their lands infested by squirrels, and shall faithfully and continuously prosecute such work until the squirrels are destroyed.

Sec. 7.—When there has been a refusal or neglect for two weeks by any land owner, claimant or occupant of land to destroy the squirrels thereon as provided for by this Act, to comply with the provisions of the last preceding section of this Act, the inspector of said district shall enter upon such unenclosed land and proceed at once to destroy the squirrels on such neglected lands, and shall cause to be filed in lieu of such intention in the Recorder's office of the county, designating the name of the delinquent owner, if known, and the land by number, or other description sufficient for its identification, shall serve notice in writing upon the occupant of the land of having filed such notice of intention, and shall keep an exact account of all expenses, including his own per diem, incurred upon such neglected lands, as owned, claimed or occupied, separately, and together with the description of the land as above provided, file the same with the Recorder, provided, however, that separate pieces or tracts of land shall belong to the same owner, may be included in one notice or description of tracts and be included in the same filing, which shall be done on the completion of the work; and provided, that the owner, claimant or occupant may exempt himself to the inspector at any time before the filing of such account by paying all costs and expenses of said expenses. The said inspector in such case will omit the filing and pay himself and employees for the work done and for the poison, and cancel the notice of lien after the filing of the aforesaid accounts and description of land, the County Recorder shall add ten per cent. of such costs, and shall proceed immediately to record the same in a book to be by him kept for that purpose. The said record shall be deemed to impart constructive notice of the aforesaid lien to all persons, and shall be deemed to relate to the time of filing the notice of intention as herein provided.

Sec. 8.—On the first Monday of October in each year the inspectors shall each employ all needful help and means, and proceed to destroy the squirrels upon unoccupied public lands in his district, within three miles of any cultivated field, and shall proceed immediately to record the same in a book to be by him kept for that purpose. The said record shall be deemed to impart constructive notice of the aforesaid lien to all persons, and shall be deemed to relate to the time of filing the notice of intention as herein provided.

Sec. 9.—On the first Monday of October in each year the inspectors shall each employ all needful help and means, and proceed to destroy the squirrels upon unoccupied public lands in his district, within three miles of any cultivated field, and shall proceed immediately to record the same in a book to be by him kept for that purpose. The said record shall be deemed to impart constructive notice of the aforesaid lien to all persons, and shall be deemed to relate to the time of filing the notice of intention as herein provided.

Sec. 10.—Each and every person owning, claiming or occupying lands in any squirrel inspection district, who refuses or neglects to comply with the requirements of this Act, is hereby held liable for, and declared to be indebted to the county in which the said squirrel inspection district is situated, to the amount of the actual expenses incurred by the inspector in destroying squirrels upon such land, as shown by the account of said inspector filed with the County Recorder, where payment may be made to such Recorder, at any time within ninety days after the filing of such account, together with the accrued costs. When payment is made to the Recorder aforesaid, he shall give his receipt for the same, and enter note of the same in the margin of the record of the satisfaction of the lien, which shall release and discharge the lien upon such lands.

Sec. 11.—When the account of any inspector has been on file with the County Recorder ninety days and the said Recorder shall pass the account over to the District Attorney, and the District Attorney shall add 15 per cent to the account for attorney's fees, and then he shall bring suit in the name of the people of the State of California, in the proper Court, to recover the amount of the account and percentage. He may bring as many actions, either to foreclose the lien or against the party owning the premises, as may be necessary to enforce the claim. Service of summons in all suits to be brought in the name of the civil actions; provided, that when there is more than one cause of action against the same party they shall all be embraced in one suit; any provision further, that when it becomes necessary to make service by publication, the Board of Supervisors may designate the owners or publishers of all newspapers in the county of their intention to publish said summons, and award the publication to which has bidder.

Sec. 12.—The proceedings in sale and redemption of property to satisfy liens under the provisions of this Act shall be as prescribed by Sections 3770, 3777, 3778, 3779, 3780, 3781, 3782, 3783, 3784, 3785 and 3786 of the Political Code, for the collection of delinquent taxes, so far as the provisions of said laws are applicable and not in conflict with the provisions of this Act.

Sec. 13. The defendant, in answer to suit, may plead, first, that he did not claim, own or occupy the land on which the squirrels were destroyed.

Sec. 14. It is hereby required of any land owner, claimant or occupant of land upon which the aforesaid inspector has commenced destroying squirrels, to assist said inspector therein, as required, and when such owner, claimant or occupant is destroying squirrels or trapping squirrels upon his land, he shall be in the employ of said inspector, and it is further required of such land owner, claimant or occupant, when he knows of squirrels upon land not his own, owned, claimed or occupied prior to aforesaid first day of April, to notify the inspector of the same.

Sec. 15. Provides that the Board of Supervisors, at the time of levying other county taxes, shall levy a tax sufficient for the requirements of this Act; provided, that such tax shall not exceed twenty-five cents on each one hundred dollars' worth of taxable property in the county which tax shall be assessed and collected as other county taxes, and paid into the county treasury, to the credit of the Squirrel Nuisance Abatement Fund, which is hereby created.

Sec. 16. The County Recorder and District Attorney shall each pay over all the money received by either of them, as compensation for the services of this Act, to the County Treasurer, to the credit of the Squirrel Nuisance Abatement Fund, which is herein provided.

Sec. 17.—All employees of the inspector provided for by this Act shall be entitled to compensation, which shall not exceed $3 per day for actual service; and when not paid by the inspector shall be paid as herein provided for.

Sec. 18. All the expenses incurred in carrying on the provisions of this Act, when not settled for by the land owners, claimants or occupants, shall be paid from the Squirrel Nuisance Abatement Fund provided for by this Act. Warrants drawing 7 per cent. per annum interest, shall be issued by order of the Board of Supervisors on all approved claims thereon, payable by the treasurer from the said fund.

Sec. 19.—Each squirrel inspector shall at first render a detailed account, under oath, to the Board of Supervisors for all the money he receives of land owners, claimants and occupants, for the purposes of provisions of this Act; and he shall present all claims for himself and employees, verified, to the Board of Supervisors.

Sec. 20.—The owner of any land, or any party claiming an interest or right in the premises of San Joaquin, Stanislaus, Santa Cruz, Merced, Fresno, San Benito, Tulare, San Mateo, Santa Clara, Monterey and Kern, shall have the right to enter upon the same for the purpose of destroying squirrels, in case the lessee or other occupant shall neglect to destroy them; and parties so entering shall be responsible for any unreasonable or unnecessary damages to the premises or crops from such entry and no entry on lands for the real or nominal purpose of destroying squirrels thereon shall be deemed or held to establish or give color of claim to the property, except as herein provided, nor is any authority herein given of entry upon lands for other purposes than inspection and destruction of squirrels, as in this Act provided.

Sec. 21.—All Acts or parts of Acts in conflict with this Act are hereby repealed.

Sec. 22.—This Act shall take effect immediately

A very fat animal is never fit for successful breeding, and on well known physiological principles, a very fat ram, as a general thing, does not get as good lambs as a ram in just good condition, who has had ample exercise and enough feed—that is, and bounding with health and elasticity.

THE GAME LAW.

When Fish May be Taken and Game Killed Under Present Regulations.

As the game season approaches, much interest is felt by sportsman to learn the changes in the laws with regard to killing game that were effected by the last Legislature. The new sporting journal, the *Pacific Life*, gives the following synopsis of the laws on this subject as they now stand, which will no doubt be found to be correct:

The close season for salmon commenced August 1st, and extends to November 1st. Under the law passed at the last session of the Legislature it is made a misdemeanor to catch, transport or have in possession fresh salmon during this period. The penalty for a violation of the law is from $50 to $200, and this is divided between the informer, the prosecuting attorney and the school fund of the county

Every person who, between the 1st day of January and the 1st day of September of each year, takes, kills or destroys any elk, deer, mountain sheep, or antelope, is guilty of a misdemeanor; and every person who shall take, kill or destroy any of the animals herein mentioned, at any time, unless the carcass of such animal is used or preserved by the person slaying it, or is sold for food, is guilty of a misdemeanor. Any person catching or having in his possession, or offering for sale, shad, at any time prior to the first Monday of December, 1877, is guilty of a misdemeanor. The following counties are excepted from the provisions of this section: Del Norte, Humboldt, Shasta and Mendocino.

Section 626 of the Penal Code was amended last winter to read as follows: Every person who, in the counties of San Bernardino or Los Angeles, between the first day of April of any year and the first day of August of the same year, or who in any other of the counties of this State, excepting the counties of Lassen, Plumas, and Sierra, between the 15th day of March and the 15th day of September in each year, takes, kills or destroys quail, partridge, or grouse, mallard, or wood duck, species of any kind of broad bill ducks, is guilty of a misdemeanor.

Sec. 631.—Every person who, between the 15th day of October and the 15th day of the 1st day of April in the following year, takes or catches any trout is guilty of a misdemeanor.

Sec. 632. Every person who, in the counties of Alpine, Santa Clara, Santa Cruz, Lake, San Mateo, Monterey, Sonoma, Tuolumne, Alameda, Marin, Nevada, Placer, Plumas, Sierra, San Luis Obispo, Solano, Mariposa, Mendocino, or Napa, at any time, takes or catches any trout except with hook and line is guilty of a misdemeanor.

Sec. 633.—Every person who takes, catches or kills any trout by the use of nets, weirs, baskets, or traps, is guilty of a misdemeanor.

The penalty for the violation of the law is as follows:

Except in cases where a different punishment is prescribed by the Code, every offence declared to be a misdemeanor is punishable by imprisonment in a county jail not exceeding six months, or by a fine not exceeding $500, or both.

The Board of Supervisors of Santa Cruz county, at their meeting on the first Monday in August, changed the deer law so that hunters may kill deer from the 15th of August to the 1st of January, instead of (as heretofore) from the 1st of September to the 1st of January.

WITHOUT an agricultural paper, the former is confined chiefly to his own limited experience. He cannot profit by the experience of the world at large, for he knows not what is going on in his own profession, even.

A good agricultural paper may be compared to a sea that gathers waters from a thousand tributaries. So an agricultural paper gathers knowledge, experience, wisdom, from hundreds of intelligent, practical correspondents, and from other agricultural papers, and thus furnishes an exhaustless store of information to the farmer. Hence, every farmer who follows farming for a livelihood, ought to take an agricultural paper, that he may avail himself of the valued experience it contains of others in his own profession.

The centennial anniversary of our national birth and that of the first settlement made on the Bay of San Francisco occur in conjunction. On the 9th day of October, 1776, was founded the Mission of San Francisco de los Dolores, the determining point of our present young and prosperous city. To the resident of San Francisco, therefore, this pleasant coincidence imparts to this Centennial year and great Paschal Day an additional interest, since but for the humble event above alluded to the emporium of the Pacific coast might have occupied another site on our glorious bay than the little cove of Yerba Buena.

Platform of the Independent Party.

As political platforms are pooled reading just now, and we have not seen the Independent one in any paper on this Coast, we insert this as information on an important subject:

The Independent Party is called into existence by the necessities of the people whose industries are prostrated, whose labor is deprived of its just reward as the result of the serious mismanagement of the national finances, which errors both the Republican and Democratic parties neglect to correct. And in view of the failure of these parties to furnish relief to the depressed industries of the country, thereby disappointing the just hopes and expectations of a suffering people, we declare our principles and invite all independent and patriotic men to join our ranks in this movement for financial reform and industrial emancipation.

First—We demand the immediate and unconditional repeal of the specie resumption act of January 14, 1875, and the rescue of our industries from the ruin and disaster resulting from its enforcement, and we call upon all patriotic men to organize in every Congressional district of the country, with the view of electing representatives to Congress who will carry out the wishes of the people in this regard, and stop the present suicidal and destructive policy of contraction.

Second—We believe that the United States note issued directly by the Government and convertible on demand into United States obligations, bearing an equitable rate of interest, not exceeding one cent a day on each one hundred dollars, and interchangeable with United States notes at par will afford the best circulating medium ever devised; such United States notes should be a full legal tender for all purposes, except for the payment of such obligations as are by existing contracts expressly made payable in coin. And we hold that it is the duty of the Government to provide such a circulating medium, and insist, in the language of Thomas Jefferson, "that bank paper must be suppressed and the circulation restored to the nation, to which it belongs."

Third—It is the paramount duty of the Government in all its legislation to keep in view the full development of all legitimate business, agricultural, mining, manufacturing and commercial.

Fourth—We most earnestly protest against any further issue of gold bonds, for sale in foreign markets, by which we would be made for a long period, heavers of coal and drawers of water for foreign nations, especially as the American people would gladly and promptly take at par all the bonds the Government may need to sell, provided they are made payable at the option of the holder and bearing interest at three and sixty-five one-hundredths per cent. per annum, or a lower rate.

Fifth—We further protest against the sale of Government bonds for the purpose of purchasing silver to be used as a substitute for our more convenient and less fluctuating fractional currency, which, although well calculated to enrich the owners of silver mines, yet in operation will still further oppress in taxation an already over-burdened people.

The large amount of American cheese of superior quality now sold thereon, from Great Britain is causing considerable uneasiness in the minds of English manufacturers.

The Horse.

Walking Horses.

WE are glad to notice that many of our Western fairs are offering handsome premiums for the fastest walking horses. There is no disguising the fact that a good walk is the most useful gait that a general purpose horse can possess; and if one-half the attention were paid to cultivating this gait, and breeding with a view to its transmission, that is now given to that of training and breeding trotters, horses that could walk five miles an hour would soon be as abundant as 2:30 trotters now are. The trouble now is that the whole country is possessed of a mania for fast trotters, and as soon as the colt is broke to halter, no matter whether he be thoroughbred, Conestoga, Norman, Clydesdale, Hambletonian, or Canadian, he is put to trotting. The whole country is engaged in training trotters, from the plowboy in the field to the professional on the track, to the utter neglect of that more useful, every-day gait, the walk. Even the importers of draught stallions from Europe have caught the infection, and, instead of bringing the best walkers, we only hear of their "great trotting action." It is time to put an end to this nonsense; the gait for a draught horse is pre-eminently a walk, while nothing adds more to the ability of the roadster to make a long journey in good time than a walking gait that will carry him along at the rate of five miles an hour.

The first aim, when a colt is broken to the harness, should be to educate him to a good, fast walk, and after that has been done, if you can get him to trot fast, so much the better. One of the most successful breeders of trotting horses in America has often remarked to us that he would not keep a horse on his place that was not a fast walker, and that he had invariably found that the fastest walkers made the fastest trotters. It is a positive luxury to ride or drive a horse that can walk off with you at the rate of five miles an hour. It is such a relief to feel that when you ease up your horse from his swinging trot, or lope, that you have not come to a stand-still, but that you are yet making remarkable progress. For our own private use on the road, the walk is the gait which we prize above all others, and anything which promises to increase the number of fast walkers will receive our hearty encouragement.—*Spirit of the Times.*

ARAB HORSES.—The article on Arabia in the second volume of the new edition of the "Encyclopedia Britannica" is by William Palgrave, one of the first authorities upon the subject. A good portion of his article is given to that theme of never-failing wonder, the Arab horse. He says:

Reared under an open shed, and early habituated to the sight of man, to the sound and glitter of weapons and to all the accessories of human life, the colt grows up free from vice or timidity, and even acquires a degree of intelligence that surprises a stranger. Barley and dates are the chief stall provender; but the grass of the pasture grounds, in the selection of which much care is taken, is the ordinary nourishment of an Arabian horse. Of water the allowance is always kept purposely scant. A good Nejdee will canter four-and-twenty hours in summer time and eight-and-forty in the winter without once requiring a drink. Raw meat, dried, is occasionally given in small quantities when extra exertion is required; lucerne grass is employed for lowering the tone. Geldings are very rare. The color which most frequently occurs is gray; then comes chestnut; then white and sorrel; mottled gray and black are now and then to be found; dark bay never.

Colts are ridden early—too early, indeed—in their third, or even second year, and are soon broken into a steady walk or canter, and to the ambling pace which is a special favorite with Arab riders. Racing, an Arab amusement from time immemorial, and the game of "jerzed," a kind of tournament, or mock fight with blunt palm sticks, highly popular without the peninsula, complete the training as to wind and pace.

Saddles are seldom used in Nejd, and stirrups never; but both are occasionally employed in Hijaz and Yemen. So it is, also, with bits, the place of which is taken in Nejd by halter ropes, the real guidance of the animal being almost wholly effected by the pressure of the rider's leg and knee. Shoes, too, are of rare occurrence, nor are they needed in the light sand-mixed soil of the central provinces; on the other hand, the hoofs are often rubbed with grease to counteract the drying effects of the heated ground.

Of all niceties of grooming, docking and clipping excepted, the Arabs are masters; and their natural kindness to animals—a quality which they share with most Orientals, together with the care every reasonable man bestows on a valuable article of property—insure to an Arab horse good treatment, at the hand of its owner. But Arab horses do not commonly enter tents, nor play with the women and children, nor, in a general way, do they share the family meals, nor are they habitually kissed and cried over, as the imagination or credulity of some narrator has suggested. An Arab flying for life has, indeed, been known to give the only morsel of bread about him to his horse rather than eat it himself—an act in which self-preservation had as large a share as affection. Lastly, the standing prohibition of horse selling from Nejd has really nothing more romantic in it than unreasonably unlimited application of the principles of protective monopoly; in other cases, reluctance to conclude a bargain simply indicates that the offer made was insufficient.

THE ORLOFFS OF RUSSIA.—A recent traveler describes them as driven in shafts, often between two running mates, at the top of their speed, for miles, and rarely or never breaking their square, quick trot. Thoroughbred horses, English hunters or Arabians, are used for their mates, and we can judge very well that there must be a speed obtained which would be judged respectable even on our fashionable trotting courses. This breed is the result of discreet breeding of a single man, Count Orloff. It has a reputation of being composed of a large supply of the best Oriental (chiefly Arabian) blood, mingled with that of some English, and more of the best trotting stock of Europe, (Russia, Germany and Denmark.)

It seems probable that we shall not see American trotters established as a uniform breed, until some one, or some company of breeders, systematically diffuse (not cross) thoroughbred blood of some sort, either English or Arabian, through that of a well selected group of mares of our most famous trotting families. It is a work of years, and fixed results would hardly be expected before the third or fourth generation.

I have been led without thinking into this discussion of the subject of breeding trotters, when I intended merely to contrast the breeding of draft horses with that of trotters, and to impress the fact that the trotting horse is generally a heavy bill of expense to his breeder, and a disappointment when sold, while first class draft and express horses, and stylish carriage horses may be bred with a certainty of reward, which is always the highest satisfaction to the breeder.

I may here mention an interesting fact which came recently under my observation while abroad, and that is, that the Russians are using the established breed of Count Orloff to develop sub-races or branches of the breed. Among these is the Orloff carriage horse. Those which I saw were superb 15⅞-hand stallions, coal black, light-limbed, upheaded, level, and powerfully muscled, with high, stylish action, and reputed to be very honest trotters. What a boon it would be to this country to have such a breed!—*Cor. Am. Agriculturist.*

PERCHERON HORSES.—These horses do not originate exclusively in Perche, as believed by many; in fact, this province is rather devoted to raising horses than to breeding them. The intelligent farmers of that section buy horses old enough to work, bred in Vendee, Poitou, Bretagne, Normandie, Picardie, Artois, and even in Champagne, Nivernais, Bourgogne and Franche-Comte. These are selected with good judgment from all the principal races of French horses, being the best specimens, their color, form and style must correspond with what is known as the Percheron horse. They are well fed for one or two years, and are thus modified, *Percheus*, by the large amount of oats fed by these farmers. They derive their good qualities less from their ancestors than from the oat sack (Magne). This idea may be a useful hint to some American breeders who have been dissatisfied with the results of breeding to Percheron stallions. It may also be interesting to know that the prestige of the gray color is losing ground, and that there is now a movement among the breeders to produce Percherons of a bay or other dark color.

CLYDE HORSES.—The London *Field* says that Clydesdale breeding in Scotland has grown in popularity, and is apparently increasing. The Clydesdale is admittedly the best sire for a farm stud. The great rise in the price of horses has stimulated farmers in breeding, and the encouragement given to this valuable breed of horses by the Glasgow Agricultural Society has aided in the improvement of the Scotch farm horses. The best animals in the country are annually attracted to the Glasgow meeting, and there the agricultural clubs throughout the country have facilities for selecting worthy sires, which are nowhere else obtainable.

REMEDY FOR WORMS.—A correspondent of the Maine *Farmer* gives this remedy for curing worms in horses: I have found linseed meal the best thing I ever used. Give from a pint to a quart for a few days, then a less quantity will do. I usually give this in shorts, meal or oats mixed with boiling water, and a little salt put in every day. In some cases a few doses of sour apples, without anything else, will remove worms. I like remedies that are easily given. The meal is a good feed for horses in small quantities, if they are not troubled with worms.

CURE FOR SCRATCHES.—Take a piece of buestone the size of a large kernel of wheat; dissolve in one-half teacup of hot water; when cool, apply with a swab two or three times a day; the parts to be washed clean and wiped dry first.

WORMS.—A horse is not inconvenienced by worms while in a state of health; they are the result of indigestion. The object to be accomplished is to give the digestive organs a healthy tone. When, from an unhealthy condition of the digestive organs, worms have gathered in the intestinal canal, give bitter tonics and alteratives, which are obnoxious to them; they then die and pass off as fecal matter. Give powdered poplar bark, powdered sulphur and powdered salt, in equal parts. Dose, one tablespoonful, in bran or other feed.

Pisciculture.

Conveyance of Live Fish.

WE are beginning to learn that up to a certain point, the value of water for non-lung-breathing aquatic animals does not so much depend on its amount as upon its distribution in such a manner that it shall absorb the greatest quantity of atmospheric air, or rather of the oxygen which enters into the composition of that air, leaving much of the nitrogen out unabsorbed. The earliest observer known to me of this fact was the late Dr. R. Ball, who, in Bell's *British Crustacea*, records how much better he kept a crayfish (Astacus) in a shallow vessel than in a deep one. In all my aquarium work I keep this law in view, and I regulate the amount of surface of water exposed to air, as well as the actual quantity of water, according to the known requirements of the animals to be kept; and the result is very surprising both on the health of the creatures and in the saving of the maintaining aquaria.

I also apply the rule to the conveyance of aquarium animals. To give an actual example, I find that the following animals and some others may, at certain temperatures, be safely sent from Southend, in Essex, to the Crystal Palace in boxes (or preferably in baskets) packed in damp, freshly gathered sea-weed: 1, nearly all the sea anemones; 2, most of the Nudibranchiata; 3, a large number of Annalids; 4, many Crustacea; 5, some of the Tunicata; 6, nearly all shelled Mollusca, both univalves and bivalves, and some of the Nudibranchiata; the following fishes: Anaplexus (this once came alive from Naples in a post letter, and four of them so brought are still alive in the Crystal Palace aquarium), plaice, soles, brill, rocklinhs, eels, gobies, blennies (of three species), sea scorpions.

The explanation of the reason why they so travel is this: They are surrounded with moisture in a sufficient degree to enable respiration to be carried on. Take, for example, any fish so conveyed. It is not immersed in water, but its gills are kept wet by such very thin films of water that their thinness, otherwise shallowness enables them to be instantly oxygenated by contact with the atmospheric air, which enters the apertures of the containing box or basket, and which permeates the entire mass, and therefore the gill filaments are kept wet and separate from one another, and the blood uninterruptedly flows through them, and is aerated as it does so, oxygen being absorbed from the perfectly aerated water, which thus does double duty in a measure. I admit that the balance thus maintained is a delicate one, and is easily disturbed by external causes. Thus, a heated atmosphere would cause the moisture to evaporate and the gills to dry up, and the fish or other creature would soon die. So also great cold would freeze the gills into a temporarily

dry mass, and death would likely ensue. But there is one thing which I do not yet understand, and which I should be very grateful to have explained. It is this, that while many of the creatures I have named will bear the four hours' journey from Southend, some of them will not bear the twelve hours' transit from Plymouth, though equal care be apparently taken with the packing in both cases. But when such packing is possible the gain is enormous in everything. We often at the Palace get a couple of thousand of animals, or more, in packages weighing not altogether half a hundred weight, while if the same animals needed to be conveyed in properly aerated vessels of actual water, such creatures would require a pound weight of water instead of only a fraction of a grain weight to each. The money value of the moist plan is strikingly shown in the instance of shrimps, of which we use about a ton weight every year at the Crystal Place Aquarium, for feeding purposes; and we require them alive, because many animals refuse to eat them when dead. They cost us in good condition about a shilling a quart; but if it was necessary to bring them alive in water, they would cost at least a guinea a quart.—*W. A. Lloyd in London Zoologist.*

How the Indians Fish for Salmon.—While on the head-waters of the Sacramento river last year I had several opportunities of seeing the Indians catch the salmon, which serves them for food during the winter, and, in fact, during the whole year. The Indians, not being subject to the prohibition of the game laws, are allowed to take game at any season of the year, and they take the salmon when they are in the river to spawn, at which time they come in in immense numbers. The Indians take them by means of spears, one of which I measured and found it only a few inches short of twenty-five feet in length, and the *modus operandi* is as follows:

The Sacramento near its head is very swift, and in its passage across different ledges of various degrees of softness it excavates large pools or holes in its bed, each having a small fall at the head, and a rapid beyond. The water in these holes, which are often very large, is comparatively still, and they make welcome resting places for the tired salmon before they attempt the passage of the rapid above; they collect in them in great numbers, the water is beautifully cold and clear, and the fish can be seen crowded together on the bottom. The Indians repair to one of these holes to the number of twenty or more, and a fine picture they make as they stand in position to strike when the word is given, nearly naked, with their brown skin shining, and eyes glittering in anticipation of the sport. Some station themselves at the rapids above and below the hole, others wade out to an isolated rock, or a log projecting into the stream. All hold their spears in readiness, and at a grunt from the leader they commence business.

At the first onslaught all generally manage to secure a fish, which is detached from the spear and thrown on the bank, the spears, by the way, having barbs of steel, which become detached from the stock when they enter the fish, and being attached to the shaft by cords, turn flat against the fish's side, and make escape impossible when the salmon is pierced through. The Indians proceed silently with their work, and secure a great many fish before they escape from the hole. Sometimes three or four hundred are thus speared out of one pool.

They are very cautious about making their preparations so as not to frighten the fish till all are ready, and then to confuse them by a sudden onslaught. The fish are split open and dried in the sun on the bushes, which present a curious appearance, all hung with the bright red flesh; they are then slightly smoked and reduced to small flakes, and laid away for future use. The roes also of "mahalies," as they call the females, are carefully saved and dried, and are considered a great delicacy by the Indians; but I never heard of white men eating them, although I should think that if cooked while fresh, they would be quite palatable.

The trout fishing of this region was also said by some English lords who were fishing there to be superior to anything they had ever seen, each fly on a flight of six being taken in one lake as soon as they touched the water; and these are not lake trout, mind you, but brook trout, or rather river trout, which enter the lake through a stream connected with the river. The Dolly Varden trout, as it is called on account of the large red spots along its sides, is also found in no other stream. This fish has until lately been unknown to all but the old hunters of the region, and is certainly the gamest fish I ever saw, salmon not excepted. It weighs from four to eight pounds, and when hooked takes the hook between its teeth, like a horse seizing the bit, and makes a rush of sometimes eighty yards in a straight course, continuing these spurts until exhausted. They seem to be of large size, and are inclined to be cannibalistic.—*Forest and Stream.*

Fish Culture in France.—The French Legislature has decided that fish culture shall form a part of the programme of all farm schools. This was a branch of rural industry formerly much cultivated in this country, especially in reference to carp, which is a most prolific and easily propagated fish. Weight for weight, it fetches nearly as high a price as beef, and no farm stock can manufacture flesh so rapidly as carp. Any pool of water can raise the fry; at two years of age, they must be transferred to larger spaces of water, and even then, can command at the rates of 200 fr. per 1000 head.

There is a pisciultural society in Monterey county which is alive and working to introduce into the waters of that county a stock of all the best varieties of fish. Their example could be followed by many other districts with profit.

Apiary.

Bee-Keeping in Los Angeles.

As a specimen of what has and can be done by some of the leading apiarists of this county, we give the following figures of the amount of honey produced the present season by Harmon, Loop & May, at their ranch near San Fernando station. On the first of April this firm had 140 stands of bees and up to the 15th of this month had extracted some 50,000 pounds of honey of superior quality, and are still getting some honey of a poorer grade, of which the amount will probably reach 10,000 pounds, making a total for the season, or since April last, of 60,000 pounds. Of this amount, 10,000 pounds has been shipped to Chicago, a small quantity to San Francisco, and two or three thousand pounds sold in this city. The firm now have 20,000 pounds in the depot at San Fernando, with which they intend to load the first car through from Los Angeles to Chicago. They also expect to ship the remainder of their crop to Chicago, where they have established an ahency for the sale of it at wholesale to dealers in that vicinity. The honey is mostly put up in cans containing about seven pounds, and packed in cases containing eight or twelve cans each, which makes it in convenient shape for the retail trade. In addition to the honey produced this season, they have increased their 140 stands of bees to 450, and have transformed a wild, desolate patch of greecewood and sage brush to one of the most delightful places of residence in the county, being nearly 2,000 feet above the ocean, overlooking the Coast Range of mountains, accessible by the best of roads, and within three miles of San Fernando. It is stated, on good authority, that the annual product of honey in this county is over 1,500,000 pounds, which has a market value of $150,000. Of course, this does not include the thousands of pounds of wax produced, selling at twenty cents per pound, which would greatly increase the figures.—*Weekly Mirror, Aug.* 26.

Comb Foundation.—"What is comb foundation?" The following, from the *American Bee Journal* for May is an explicit answer:

Take a piece of empty honey comb and cut off all the cells, until nothing is left but the division wall of wax between the two opposite sets of cells, and you have a comb foundation. The latest production, however, consists not merely of the dividing wall, but also a slight depth of the cell-walls themselves, on each side, and these cell-walls, although slight in depth, may be of such thickness as to contain enough wax, so that the bees may work out or prolong the cells to their full depth without any additional material.

These come foundations are given to the bees in their brood chamber, enough being put in a frame to fill it, in whole or in part, perhaps only a narrow strip being used for the bees to start upon. They are also used for surplus honey, enough being given to fill the boxes, or merely enough to give the bees a start. The object is to save the time of the bees in secreting the wax, as also the honey used in its production. Another object is to secure all straight, worker comb, and still another to hasten the commencement of work in boxes when the bees are loth to enter them.

Thus much by way of answer to those who are asking: "What is comb foundation, and what is it for?"

Parasites on Bees.—The *Rural World* reports that at the last meeting of the St. Louis Academy of Sciences, Prof. C. V. Riley, the President, read a communication from G. W. Barnes, of San Diego, Cal., in relation to parasites upon bees in that State. The parasite was described as of the color of a flaxseed and easily distinguished by the naked eye. It appears usually under the wing of the bee, and adheres with considerable tenacity. It occasionally crawls all over the bee, and is quite agile in its movements. The bees afflicted with the vermin become agitated and move rapidly over the comb, frequently dying of injuries. The parasites were first noticed there last year, and have again appeared this season, giving considerable trouble in large apiaries. Specimens of the insects afflicted accompanied the letter, and Prof. Riley said the parasite was the larva of the blister beetle. It was well known that these larvæ attached themselves to bees and were thus carried into the hive, where they usually left the grown bee and attacked the larvæ. Prof. Riley had not before heard that these insects injured the fully developed bees. The information was valuable, if reliable.—*Rural New-Yorker.*

Bees Stinging.—For fifteen years I kept bees in my garden at 6 Lordship Terrace, Stoke Newington, the hives being literally shut in on three sides by houses; and in that time I never heard a complaint of any one ever having been hurt, or alarmed or threatened.

The bee, like man, is a creature of habit. When thoroughly accustomed to human society, the industrious insect plods on in the most peaceable and lawabiding manner; hence, while a town bee may be interrupted with impunity, a country bee is apt to sting when seriously interfered with, especially when checked in the prosecution of daily duty. During the fifteen years my bees saw much of society, they were remarkably docile and manageable, and I could catch them on the wing, retain them in my hands, and after some seconds liberate them, to see them dart like an arrow to the hive, and I was never stung by the prisoners. But when I planted my bee shed in a lonely spot, and the only saw open meadow, they soon became so far savage that I could no longer handle them safely.—*Shirley Hibbard in London Times.*

Subduing Bees.—The stings of bees were given them for the protection of their stores. They are not disposed to sting when not in danger, and every bee which does sting dies. Away from their own hive they rarely make an attack. The natural dread of stings deters many from keeping bees who would be glad to do so. In the use of modern hives, the danger of being stung is lessened, as these give you facilities for subduing them. A bee with its honey sac full never stings. When you alarm a colony of bees, they all instinctively at once fill their sacs with honey, and after time has been allowed them to do this, their hive can be opened and examined with no danger from their anger.—*Mrs. Tupper.*

Porcine.

TRICHINOSIS.

An Important Subject.

A FEW years ago, says the *Country Gentleman*, no one would have known the meaning of this term—save some technical scientist—certainly no farmer, because we are just beginning to realize that it means a horrible disease. It certainly is to be wished that our learned friends would not frighten us so often with these long words. Why not call it what it is, the *pork distemper?* And a dreadful distemper it is getting to be, call it by what name we will, and by none will it smell sweet, and the sooner we know all about it and avoid it, the better. Professor Verrill some years ago explained its origen before the Connecticut State Board of Agriculture. Professor Cressy, of Amherst Agricultural College, has on various occasions brought it before the farmers of Massachusetts, and quite recently Dr. Sutton, of Indiana, has made a report describing in full the symptoms and mode of treatment of the disease, to the Indiana Medical Society, which, if not pleasant reading to pork-raisers and eaters, is of great moment to them and the general public—although, perhaps,

"pork-eaters" is a phrase synonymous with "general public." Dr. Sutton says that from a microscopic examination of pork killed in southeastern Indiana, from three to sixteen per cent. of the hogs are affected with trichinæ—the worm causing the disease in man; that over five millions of hogs are slaughtered and packed in the Western States, not including those which are put up for family use by the farmers. If four per cent. of this pork is diseased, which the report thinks a low estimate, then there are 221,184 diseased hogs put annually upon the market, in addition to the wormy ones retained by the farmers on which to regale themselves and families. Ninety per cent. of disease produced from eating trichinous pork appears either as gastro-enteritis (something horrible from its being disguised in such a name), or as diarrhœa and dysentery, and these diseases cause a mortality of thousands in the United States every year, and as I shall show hereafter, the sufferings of those who are not privileged to die are horrible from the same cause.

Now, it is time to come together and see if this horrible slaughter and suffering of human beings cannot be stopped, and the first thing is to find out the reason and cause, remote and immediate, of the disease, and then consider the means of removing it.

In addition to the external parasites of domestic animals, they are inhabited by internal parasites, and most of the latter belong to the great class of articulated animals known as worms, constituting several distinct orders, and it is a remarkable fact that the worst of thes creatures are kept in existence only by reason of the intimate relation existing between man and his brutish dependents. The two most common tapeworms, derived respectively from the flesh of cattle and hogs, in which the young worms live, appear to be capable of coming to maturity only in the human intestine, another proof of the fact of our kinship to the lower creation underneath us, and further corroborated by what some may consider the mortifying fact that the internal arrangements, the viscera, omnivorous propensities, and the general physiological structure of the hog (and also the bear) more nearly resemble man than any other animal.

But passing over the pork tapeworm, which is acquired in man by eating raw or underdone pork, and the beef tapeworm acquired by eating dried beef and bologna sausages, cooked, and raw meats, and both productive of disease enough to make us satisfied that such diet should be avoided, we come to the causes of the more terrible trouble, the flesh-worm, the *trichina spiralis*, one of the *nematodes* or round worm family, and the most important and most dangerous of all human parasites. This minute worm in the larvæ state lives in the muscles, not only of swine and his kindred, men and monkeys, but in those of dogs, cats, rats, mice, guinea pigs, and many other animals, and in the mature state inhabits the intestines of the same animals; but it is to be borne in mind, in view of the remedies proposed for the disease the worm gives rise to, that no noxious effects are produced, except from the eating by the human species of the flesh of swine in the condition that they are. Kept by civilized man for fattening, selling and eating. Microscopic examination of the muscular tissue of a wild boar lately shot in Saxony, showed it to be full of trichinæ, but no one has ever heard of the "pork distemper" from partaking of the meat in its wild state, nor from eating any of the other animals subject to the trichina. The young parasites are so small as to be quite invisible to the naked eye, and "millions of them may exist," says Prof. Verrill, "in the flesh of a pig without producing any unusual appearance in the meatt sufficient to attract the attention even of an export." If the pork containing these worms is eaten by man, they become liberated in the stomach, and entering the intestines there grow rapidly, and become mature in two days. One ounce of pork may contain a quarter of a million or more of these worms, which, as soon as born, begin to eat and force their way through the membrane of the intestines and into the minute blood vessels and other organs, and entering the circulation they are carried by the blood to the heart, thence to the lungs, and then become diffused through the whole system, causing an immense amount of inflammation and irritation, intense soreness and pain, and death in some cases occurs from the fifth to the fiftieth day. It was not until Dr. Zenker, of Dresden, in 1860, made the surprising discovery that the trichina, which up till then had been considered a harmless little animal, could cause the death of a man, that these results became known by farther investigation, and that to the swallowing of these "worms that never die" was owing so many fevers, poisoning, and various diseases hitherto ascribed to other causes. Since that time a series of epidemics of this disease has occurred in Germany, where they eat more raw pork than elsewhere, and thousands of cases have been observed, and many dissections have taken place, and the fact established beyond any doubt as to the cause. Numerous cases have since occurred, and are constantly occurring all over the United States, traced to eating rare done, or raw pork, principally ham, where the muscles which these worms inhabit in their larvæ state are most numerous; sausages, occasionally roast pork, and pork that had been boiled an hour or two, although it is supposed that a trichina, exposed to the boiling point will die; but it is rarely that the whole of the meat cooked is exposed to this temperature, the inner parts not unfrequently coming on to the table half or wholly under-done. Experiments have shown that a large piece of meat which had been put into a kettle over a good fire, after boiling half an hour, had cooked only partly through, and had to be cut up and cooked as long again, to reach a temperature sufficient to kill the trichinæ.

When we realize that many thousand people, according to Dr. Sutton's estimate, die annually in the United States from trichinosis, and perhaps as many more are suffering horribly—almost a daily death—from distempers engendered by the same cause, it is a matter of moment to us farmers who produce and distribute, and eat, and bring up our families on pork, to see if something cannot be done to prevent such dreadful effects.

Of course, after these facts become known, no sane person will eat pork or meat of any kind unless it is thoroughly cooked; no dried or smoked beef, or ham, which has not been purified by fire (infants fed upon dried beef, a custom in vogue in Russia, being especially liable to be infested by tapeworms, and probably trichinæ); but we must go beyond this to strike at the seat of the disease.

It is evident, as before stated, that this disease, so fatal and horrible in all its aspects, is communicated from those penned together in filth, and fed on offal, often of the very worst nature, such as that of diseased animals, and other matter too villainous to mention. The hog is naturally a clean animal, and in his native state will be as free from disease as cattle; and we have no evidence of the trichinous disease ever infecting any person from eating of wild boars, nor of the herds of swine kept in ancient times, even in hot countries, nor of pork from pigs kept in a cleanly condition, and not shut up in close and filthy quarters with others. In fact, the diseases of the hog are bred from the dirt, wet, filth and bad air to which he is forced. Like any other "gentleman" who is put in close quarters, deprived of proper food and raiment, with no chance to bathe, and crowded upon by other prisoners as bad off as himself, he soon becomes disgusting; the internal and external parasites prey upon him, sores and diseases break out, and he communicates these to those other unhappy ones with whom he comes in contact. There are said to be upwards of a hundred species of internal parasitic worms found in domestic animals and man, but they are kept in their proper place by the general health and cleanliness of their *habitats*; but let the latter neglect these precautions, and the same results follow as to the vegetable creation—the apple and other fruit trees—whose parasites take advantage of any neglect of growth or cleanliness to destroy them.

The trichina in human flesh (for it occurs both in pork and in human muscle) is a very minute spirally coiled worm, scarcely visible to the naked eye, and either enclosed in a cyst, or unencysted. If a piece of pork containing these worms be consumed by man, these larvæ develop in the course of two days into sexually mature worms, and in four days more, numerous embryos are given off; these being small and vigorous worms, attack and bore through the intestines, passing into various parts of the body of their host. Chiefly, however, they lodge in the voluntary muscles, there to perish by the natural process of conversion into little limy particles, unless, indeed, cannibalistic ideas should come into vogue.

The disease set up by these parasites in boring their way into all parts of the body is called trichinosis, or trichiniasis. The symptoms of this are prostration and general indisposition, which stage may last about a week, followed by pain in the limbs, swelling of the face, and fever. This shows that the trichinæ are making their way into the various muscles. About the fourth week, the parasites may be regarded as settled in their new home; and the third stage, which is characterized by extreme weakness, supervenes. The general indications in the way of treatment are active purgation at first, followed by all means calculated to support the strength of the patient.

Hygienic.

PRACTICAL HEALTH TOPICS—NO. 5.

BY "JEWELL."

EXERCISE.

One of the most necessary habits conducive to health is exercise. By it the blood is sent to the extremities, and a healthful glow is felt from heart to finger-tips, cheeks and lips show their welcome in rosy coloring, and the step is made elastic by its magic power. Even the woman of society is beginning to understand its magic effects, and while she spurns *work*, she will nevertheless go to the gymnasium, "lift cure," or bathing establishment, there to *sweat*, or exercise in the fashionable way to gain the beauty of complexion her inactive life destroys.

I read an interesting account of a lady of wealth, whose complexion was ruined by dissipation, taking a subordinate position in a Turkish bath house where, by constant exercise and sweating, she gained a beauty of skin envied by her "circle" without the *disgrace* of labor becoming known.

And right here I would ask whether we do not make too great a distinction between work and exercise? As educated men and women, feeling the beauty of harmony in life, do we not, by our actions, degrade labor—shunning the laborer, and not seeking the toiling ones, while the idle and rich are courted and sought for? As parents, do we not give or boys *professions*, rather than *trades*, if we can afford it? and our girls accomplishments to fit them to *adorn* homes, rather than to *cheer* and *make* them what they ought to be? I would not advocate constant labor, excluding rest and recreation. Were all to contribute sufficient for their health, we would not see so many over-worked ones and a corresponding number of under-worked invalids for the want of something to do to give them sufficient exercise to keep well.

Think of the amount of strength wasted at these "lift cures" and gymnasiums, which, if rightly used, would benefit mankind immensely. Yet it is better for those leading sedentary lives to take such physical exercise than none at all. Business or home duties should provide the exercise daily needed. Our children should be encouraged to use their limbs in active sports, and be provided with the means of so doing. Our schools should contain apparatus, in a big room, to amuse and give exercise, under instruction, to pupils of both sexes, in wet weather, when out-door games are impossible. We should all be educated into the idea that it is a duty we owe ourselves to exercise daily sufficiently, and in such a manner as to best develop and preserve good health, and that it is honorable to be usefully employed while exercising. Labor should not be drudgery, nor exercise idleness. Exercise for health, and health will give a zest to useful employments.

How Farmers' Wives Break Down. A woman tells this story to the Boston *Cultivator*, and many can testify of their own knowledge that it is sadly true:

She has four little girls the oldest six years and the youngest three months. Her husband keeps six cows, and cultivates a farm of a hundred acres, employing two men to aid him. Three meals must be cooked daily for a family of seven, not counting the baby, four children dressed and cared for; the milk of six cows attended to, and butter made while the weekly washing and ironing must be accomplished in some way. From four o'clock in the morning till ten and sometimes eleven at night, one pair of hands and one pair of feet to perform this labor, and now that tired body rebels and says: "This cannot be endured."

Let me tell you of another case: The farmer and his wife have three children, all under eight years. He employs two hired men, boarding them, and keeps eleven cows. A woman comes in to do the washing and ironing, but that is all the assistance the wife receives, except the few steps her children save her. She

must rise at four o'clock and prepare breakfast, so that her husband and the "hands" can be in the field by five. Every other day, however, one of the hired men remains to do the churning for her; but this favor was not allowed her until she had threatened to call in the doctor to declare to her husband her inability to do such work. Then it was reluctantly conceded, although two forty-pound firkins of butter were packed each week; for our farmer prides himself on his herd of cows—pure blood Alderneys—and sells his butter at the highest rates, carefully depositing its proceeds in the bank and rarely giving his wife so much as a five-dollar bill of it. His last injunction to the "hand" is, "John, come just as quick as you can. Don't let Mrs. M. keep you for anything else. Hay can't wait for woman's work." There are dishes to wash, milk to skim, pans to scald, beds to make, children to dress, baby to nurse, rooms to sweep, and dinner to cook over the boiling hot stove; and one woman to do it all!"

Botany.

Classification in Botany.

ONE of the earliest methodical arrangements in a systematic classification in botany was made by Cæsalpinas, a Roman physician. Though artificial, the same may be affirmed of the systems of Gerner, Morrison, Rivinus, etc. These have been displaced by the attractive scheme of Linnæus, who must be looked upon as the great promulgator of the artificial method of classification. John Ray, an English botanist, in the year 1682, made the first attempt at arranging plants according to their affinities. Ray's scheme was very imperfect, for the number of plants then known was comparatively small, yet it has really formed the foundation of every later system. It was long neglected, and did not receive the attention it deserved until Jussien entered the field and developed Ray's views of the natural affinities in the vegetable kingdom.

Jussien's method was first made known in the year 1789, just eleven years after the death of Linnæus; since that time, the natural method has been advanced by the labors of De Candole, Brown, Endicher, Lindley and others.

Geographical botany treats of the manner in which plants are affected by climate and station, and endeavors to determine the conditions under which different families or species of plants are confined to certain zones of latitude and altitude. It is a study of great interest, and one which cannot be successfully prosecuted without an ultimate acquaintance with most of the sciences. Of course, so long as there are vast tracts of continents unexplored by botanical travelers, the knowledge upon which this department is founded must be imperfect.

Fossil botany investigates the nature of the plants found in a fossil state in the various geological formations; it is, therefore, a branch of botany and geology.

The practical bearings of botany are most important, and are sometimes treated separately in manuals of the science, under the head of Economic Botany. All the principal plants affording food, timber, medicine, fibre, dye-stuffs and other useful products, are noticed under the names of the genera which include them, and for further details of structure and classification of plants, those wishing to become perfect in botany, may study such works as "Lindley's Introduction to Botany," "Elements of Botany and the Vegetable Kingdom," and the works of Balfour, Henfrey, Henslow, Oliver and Gray.

Women.

[Original.]

TO SISTER RETTA.

BY LOU.

Oh, sister, have faith and be cheerful,
Dwell not on the dark side of life;
There's music, and sunshine, and gladness,
As well as tears, sorrow, and strife.
And, though the dark side of life's picture
May greet your sad vision to-day,
You know that the sun is still shining;
Be patient—have faith—hope and pray.
How oft, in the beautiful summer,
Dark clouds veil the blue arch above,
And the weeping sky the earth drenches
With tears—tears of pity and love.

The voice of nature of grief seems full—
Her countenance betokens woe
When rages the tempest and the storm,
Not knowing that 'tis better so.
But, when the clouds have cleared away,
How beautiful and bright she seems!
Her loving robes, with pearly drops
Bedecked, reflecting Sol's bright beams!
And so it is with human hearts:
They seem more loveable and true,
Having withstood temptation's pow'r,
Than if such fate they never knew.

If bright the sun shone every day
Upon the path we mortals tread,
How soon would wither and decay, [fled!
The heart's sweet flow'rs—their fragrance
But sun, and rain, and wind, and dew,
Each have a mission to fulfill—
Each their appointed work to do,
Directed by the Higher will.

How often, in the days gone by
Have bitter tears bedimmed our eyes;
How often found those trials but,
To us, real blessings in disguise.
The trials of an adverse fate
New strength and beauty will impart
Unto the virtues of the true,
Uprooting evil from the heart.

Woman.

No star in yonder sky that shines
Can light like woman's eye impart;
The earth holds not in all its mines
A gem so rich as woman's heart.

Her voice is like the music sweet,
Poured out from airy harp alone;
Like that, when storms more loudly beat,
It yields a clearer, richer tone.

And woman's love's a holy light,
That brighter, brighter burns for aye;
Years cannot dim its radiance bright,
Nor even falsehood quench its ray.

But, like the star of Bethlehem
Of old, to Israel's shepherds given,
It marshals with its steady flame
The erring soul of man to heaven,

WOMEN AND THE CENTENNIAL LEAP YEAR.

BY A. G. S.

LEAP year is woman's year, by long custom and usage; which fact gives special interest to our grand National Centennial. Women by a sort of natural courtesy, are invested with certain social privileges during this year, not recognized in the law books, which, in these revolutionary and progressive days, may be made a mighty driving wedge for a complete victory of perfect social equality and independence. Eighteen hundred and seventy-six, then, should prove the best leap year of the whole century. Beloved sisters, improve your opportunities before too late. Make yourselves quite happy in this young, vigorous and promising country. Leap year, courtship and matrimony come under one head, and the ladies now have it all their own way. Gentlemen! take a back seat, and wait for an invitation. Ladies! become the floor managers for all the world to dance.

In a hundred years the scope of woman's sphere and influence has widened marvelously. The relation of sex is better understood. Woman knows herself, and man appreciates; and, without assumption or violence, but as natural as the rosebud develops, woman becomes the accepted and coronated queen of the realm.

The distinction of sex is universal, and runs through all nature—in the human, animal, bird, fish, insect, and vegetable kingdoms—and each is propagated, preserved, beautified and perfected by sexual elimination. Plants bloom, and fill the whole house with their fragrant charms. So woman is the flower of humanity, and, to the dreary, hum-drum, tread-mill world, she is like a mighty green-house with its millions of sweetest blossoms.

The reputed progenitors of mankind may, or may not, be mythical; but the real Adam and Eve are living actualities, being every man and woman; and the true paradise of earth is *every happy home!* Heaven is no monopoly, but is accessible to all, love being its delightful element. Every woman is a real Eve—the embodiment of love; and true marriage, the real Eden. So, under such a happy defining, every human being is born into a perfect Eden, to tend, dress and beautify it—though so few are aware of it. But, who should ask or desire anything better? There is no higher bliss.

Thus, the sphere of woman becomes exceedingly broad, and hereafter she will not skip or leap over, but reign right along. The domestic circle is her proud domain—the true Grange, council and fountain-head of formative character, for temperance, peace and all moral virtue—which extends through all society and over all nations. Her most perfect sway is in the Caucasian race. Yet, even the Mongolian, Malayan, African and Indian tribes yield something to her at the fireside, culinary board and nursery—proving HOME to be the natural and quiet avenue of her ultimate triumph and control. She kneads and moulds the savory bread, makes up the soft and downy couch, and spreads the rich and inviting table. And, if "the hand that holds the bread" is the power that makes the law, certainly woman's faithful hand, everywhere, that molds and bakes, boils and stews, and feeds the hungry multitude, will force its highest claim on the nation's statute books.

Man's boasted record is on the gory battlefield, whose dark and dreadful pages blacken all history. To build forts and arsenals, gunboats and navy ships, march invading armies, confiscate and destroy property and life, and chattelize and beastinize his fellowbeings, filling the world with widows and orphans, poverty, suffering, misery and death, man may esteem as his peculiar pride and glory—always claiming the high and solemn sanction and approbation of God and the Bible, church and religion. But women and angels, in earth and heaven, flee and hide, weeping, at the horrid and sickening spectacle.

Well may woman rejoice in her womanhood, and be glad she is not a man. For, though she is made the helpless victim of his pride or baseness in countless ways, while he is called "her gallant protector," yet, through wise and mysterious processes, in the patient course of ages, she will become his full redeemer.

It may be said that women share with men in all things; and, so far as they are mixed up and compromised, they bear the blame without complaint. Yet, we contend that the distinctive woman element of love and affection that softens, wins, persuades and charms, is a true redemptive power of humanity. This blessed principle, or moral leaven, is gaining in magnitude and strength, and is destined to become the world-conqueror. Then will come the millennium. A thousand years, or four, or one—that is the perfected leap year. All hail to that coming time—woman's era of love!

Affection binds society together by heart-ties; and, while man works and rules by force and violence, woman's better way is through smiles and tears, whispers and music, kisses, caresses and children.

"Honored be woman! She beams on the sight,
Graceful and fair, like a being of light;
Scatters around her, wherever she strays,
Roses of bliss o'er our thorn-covered ways—
Roses of paradise, sent from above,
To be gathered and twined in a garland of love."

Champlin, Minn., Sept., 1876.

GIRLS! listen to this, and with virtuous resolve demand, as your right, a pure love:

Young men of bad habits and fast tendencies never like to marry a girl of their own sort, but demand a wife above suspicion. So pure, sweet women, kept from the touch of evil through girlhood, give themselves with all their costly dower of womanhood, into the keeping of men who, in base associations, have learned to undervalue all that belongs to them, and then find no repentance in the sad after years.

There is but one way out of this, and that is for you to require in associations and marriage, purity for purity, sobriety for sobriety, honor for honor.

There is no reason why the young men of this Christian land should not be just as virtuous as its young women, and if the loss of your society be the price they are forced to pay for vice, they will not pay it.

This is plain, sensible talk, and just such as ought to be heeded by all our boys and girls, till the much needed reformation is fully established. Too much of the happiness or misery of our children depends on this for it to pass without producing deep reflection and action in the right direction.—*Ed.*

DON'T, GIRLS. Don't think that yards and yards of ribbons, ruffles and laces will add one particle to your real value. Don't make a walking milliner's shop, or a jeweler's store of yourselves, covering all that is of *real* merit within you with that which will attract only the shallow-brained.

Don't think sensible people are to be deceived by vain show: they look for the beauty of heart and mind. Don't flatter yourselves it is smart to affect ignorance of manual labor or to be ignorant of it. Don't give the subject of matrimony a thought while you are in your teens, except to qualify yourself for the responsible position it places you in; you need all that time of your life to fit yourself for it. You need to study books, the laws of life and health; to be skilled in the culinary art, as perhaps the happiness and health of hundreds are depending on your knowledge of this.

Don't give your time and talents to

the world, or to seek the things of time and sense that perish with their using. God has created you for a nobler purposs, and made you accountable for what he has given you. Don't sell your birthright for a mess of pottage.

Don't Hurry, Girls.—One of the crying evils of these times is the tendency and disposition of girls to get through girlhood hurriedly and get into womanhood, or rather into young ladyhood, without waiting to enjoy the beautiful season of girlhood. Speaking on this point, Bishop Morris says, "Wait patiently, my children, through the whole limit of your girlhood. Go not after womanhood; let it come to you. Keep out of public view. Cultivate retirement and modesty. The cares and responsibilities of life will come soon enough. When they come you will meet them, I trust, as true women should. But oh! be not so unwise as to throw away your girlhood. Rob not yoerselves of this beautiful season, which wisely spent, will brighten all your future life."

Educational.

The "Brothers of the Plow" to the "Brothers of the Pen."

"The war drums throb no longer;
The battle flags are furled;"
And now we lend together here,
The men that rule the world.
The spade my sqtire, brother,
And yours the mighty pen,
We rule the world between us;—we,
Its working, thinking men.

You at your press, my brother,
And I upon my farm,—
The one the world's great thinking brain;
And one its strong right arm.
For senators and judges,
They're but the tools we use;
And it we find they will not do,
Why better ones we'll choose.

So if we strive together,
With honest hearts and bold,
To make the century to come
Still grander than the old,
Our sons and daughters nobler far,
In soul and body free,
Shall teach the world of future days
What man was meant to be!

THE LOVE OF CHILDREN.

BY NEMO.

I LOVE not him who loves not little children. A desert of Sahara is the home without them. Those sinless faces—what arguments for virtue! What invitations to erring man back to the bowers of innocence!

And why should there be homes without children while there are so many children without homes? Men of means, men without children, gather up the innocents. They will be apostles of virtue to you, as you may be missionaries of knowledge and virtue to them.

Examples teach. The motives to moral purity multiply a thousand fold in the presence of children. He is but a barbarian who, by word or act, would tempt them into the ways vice.

He is the best lover of children who loves them for their capabilities. He sees in their rudimental faculties the undeveloped greatness of educated, capable men and women, and loves them less for what they are, than for what they may become.

Look on that tree bent, gnarled and knotted, and on this proudly wearing its leafy honors—a very symmetry. They were healthy acorns once, and the soils are alike fertile in which they grow. But outward appliances, extraneous influences dwarfed and deformed the one and developed the size and symmetry of the other. Worse than the lightning's stroke or the woodman's ax, are the causes which distort or degade the growing-up man or woman.

See that boy with his mouth bedaubed and besmeared with the juices of tobacco. Commencing at so young an age in a habit that deranges the nervous system and stupefies the intellect, his best endeavors can make him only a fraction of what he might have been. Can he who loves little children tempt them into injurious habits?

See that man staggering in the street, blaspheming his God with every breath. His friends have deserted him, his wealth has been squandered, and his hopes and prospects are blighted forever. Could he have loved little children who tempted him to the first glass?

The children are the embryonic state—the Republic in abeyance—they prophesy of the future. "Give me the education of the children of the nation," said Napoleon, "and I will govern the nation."

Ask you what is to be our future? Look to the children and receive the answer—remembering in its interpretation that knowledge and virtue, skill, habits of industry and economy are the necessary factors of good citizenship.

Athens looked well to her youth. Her wisest and best were their teachers: heroes who had won glory in the field, statesmen who had been crowned with civic honors, sages who had tathomed the depths of philosophy, and whose lives were an exemplification of the purity of their doctrines.

Socrates had won fame as a soldier, and opposed alone in the Grecian assembly the edicts of the Thirty Tyrants. But his greatest work—his crowning glory, that for which succeeding generations have remembered and loved him—was his instruction of the Athenian youth.

Plato gave eight years to the study of philosophy under Socrates, went to Italy to study in the school of the Pythagoreans, and into Egypt to learn the esoteric doctrines of the priests, before he opened the Academy for the instruction of Grecian youth.

Aristotle, beginning in his seventeenth year, gave twenty years to the Academy of Plato before he became the tutor of the son of Philip of Macedon; and he had a renown for learning as far as Grecian civilization extended when he established the Peripatetic at Athens.

Pythagoras, before he became an instructor of others, was a disciple of Thales, Pherecydes and Anaximander, and had traveled in the search of wisdom over the then known world. He had studied the esoteric philosophy of Egypt and India. He had studied the Zend-Avesta of Persia. He had visited Gaul, Arabia and Palestine. He was himself most thoroughly instructed before he assumed the role of instructor.

When American statesmen, heroes and sages shall give their latter and, therefore, their best days, to the instruction of American youth—give them the benefit of their talent, their knowledge, and their experience, we may hope that America may become what Athens has been, the light of the world and the instructor of the coming ages.

Horace Mann at Antioch is greater than Horace Mann in the Congress of the United States. Having held with great distinction various offices of civic trust, his glory culminated in the teacher. Our country has no dearth of men, but it is in sad need of more Manns.

San Jose Institute, Sept. 1876.

Household Reading.

For Better or For Worse.

You thread with tender fingers, oft,
The shining ringlets of my hair;
You tell me they are fine and soft,
And yet, you say, your heart they hold
In their long links of sunny gold—
An idle, willing prisoner there.

And you have told me, when my hand
Lay warm in yours, that in its clasp
Your future waited, great and grand,
If I should choose to let it stay.
But that, if it were drawn away,
All hope would fly beyond your grasp.

And you have said, times not a few,
That death, when'er it cross your way,
Will find your heart as firm and true
As now, when blithe, and young, and fair,
You gauge me by my shining hair
And by my smiling eyes to-day.

And though I think a truer heart
Ne'er breathed on earth than yours, I know
That if, with hand in hand we start
On life's long journey, there will come,
Ere one of us in death is dumb,
Words of regret and bitter woe.

For you love beauty; and some day,
When Time comes by and dims the fair,
He'll turn, with touch of sure decay,
My golden links to gray—and lo!
Your heart will slip its bonds and go
In new-found freedom otherwhere.

And the white hand, whose clasp in yours
Makes all, you say, your life is worth,
Might, even as its touch assures,
Be strong some day to cross your will,
And, right or wrong, persist until
It should become your bane on earth.

And when death comes, as come it must—
To me, suppose—'twill better be,
If, looking on my quiet dust,
You can say faintly through your tears,
"We have been friends for many years,
And she was very dear to me,"—

Than that, with bitter, parting sigh,
You should look back, far back again,
Along a wasted life, and cry,
"Ah, better had I lived alone!
For we had long estranged grown,
And life was naught but constant pain."

So, friends in deed, and word, and thought,
Let us shake hands and go our ways,
And some time, when the years have brought
Their many changes, we can see
That it was better things should be
Just as they were in former days.

DOTTINGS AND JOTTINGS.

BY ISAAC KINLEY.

IT is not enough to know that the "wages of sin is death." Reason may teach that every step astray is on the road to danger. Gray-haired wisdom may warn against the destruction which awaits on the right hand and on the left. Science may demonstrate that any infraction of nature's law brings inevitable retribution. Poets may sing "To enjoy is to obey." The world knows all this. And yet who is there who does not suffer in his own person the penalties of violated law, moral and physical?

Does not that man in the felon's cell know that it is not right to appropriate as his own the property of another? Is the man on the gallows ignorant that murder is a horrible crime? Was it ignorance that plunged this country into a murderous civil war? These men in office, who receive bribes and grow rich out of their stealings from the public treasury, are they so uninformed as not to know that perjury is a crime against God and man, and that peculation in office is treason to the State?

Emotion is king. We must grow to feel that there is right and wrong. In the education of youth, it is not enough that the intellect be taught. There should be developed in the pupil such a high moral sense as will be a constant restraint when temptation comes—a constant encouragement to virtue when action is demanded.

Truth is ever aggressive. One after another, the strongholds of error give way. Her sword is always unsheathed, and her banner never trails in the dust. If her followers falter or faint by the way others of more courage and endurance take their places. If the captains of her hosts prove weak or false, better soldiers are promoted from the ranks, and the battle still goes on.

"He that is without sin among you, let him first cast a stone at her," was the rebuke of Jesus of those who would inflict on a pariah the penalties of the Judaic law.

A beautiful lesson of charity is here. No one being perfect—no one being without sin, we should learn to pity rather than despise—to elevate rather than degrade the fallen. How often in our censure of others, do we heap condemnation upon ourselves!

Ego, I, myself—egotism, the most unlovable of all isms. It is impossible to admire, and difficult even to respect, the man or the woman who is ever flaunting in your face, the pronoun *I*, spoken in italics. Genius itself cannot charm, if his possessor is an egotist.

He lives most wisely for himself who forgets himself in his love for mankind. Actions are correlative forces, and who gives receives. For every good deed done, for every kind word spoken, comes a blessing. For it no repentance comes nor tortures of remorse follow.

Of less value than dust on the sole of the shoe are the professions of religion that are not exemplified by a life of virtue. He is a liar and the truth is not in him, who asseverates with his lips his love of God, and daily violates, in his acts, God's moral law.

So great a man as Bacon denied the diurnal revolution of the earth, and seriously suggested as a subject of inquiry, *whether, since the center of the earth is the center of gravity, the concave of the sky may not be the bound of levity!*

It is no merit of ours that we think to better purpose, but rather that of those who have gone before. If we have climbed higher the mountain, it is because our fathers have led the way, bridging the chasms as they went along.

No one willfully wrongs those he loves. If the world loved more it would sin less.

When all men shall learn that their enemies are also their brothers, they will hasten to be reconciled, and nations will cease to shed each other's blood.

Honor, it is said, there is among thieves. Leagued rogues and bandits are faithful to each other, and if they loved mankind as well, their vocation would be gone.

Love is the greatest of all reformers—the fulfilling of the law.

How a single train of thought seizes the mind and carries it per force, try as we may to rid ourselves of it! Call in other subjects, strive to think other thoughts—it is of no use. The place is pre-empted, and the occupant will have his way.

We may—we should condemn the wrong; but before we refuse all sympathy for the wrong-doer, let us reflect what we ourselves might have been or done had we inherited his passions and been subjected to his temptations.

But sympathy does not imply justification. We may pity but not approve. I may help my neighbor out of the mire without stopping to ask by what steps he got into it.

San Jose Institute, Sept., 1876.

MASCULINE SUPREMACY.

BY "GIRLS' RIGHTS."

Now Grandpa says: "When masculine supremacy is duly observed in its legitimate sphere, you have there found always the most happiness." Yes, that is right. But Grandpa is not quite clear in defining the boundaries of that "legitimate sphere" in the case he points to to show the good results that came from a firm adherence to the doctrine of "masculine supremacy" in the husband. It may have been very well in that particular case; but I fail to see how it proves anything in favor of "masculine supremacy" in other cases. Now I could mention a good many cases where husbands have used this assumed supremacy to the ruin of their fortunes and brought their wives to poverty and privation, when, if they had listened to the good judgment and earnest entreaties of their wives, or had observed their rights in the premises, they might have been saved from that disaster.

Again, he says, "it is the *husband's* home" the wife comes to, and "he only is competent to judge," etc. Now, couple this last sentence with another further back, "where is the wife who does not love her husband the more for being able to confide in him," etc., and we can draw a conclusion, and that is, if you have made up your mind that *he* is competent, and that *you* are not competent to judge in these matters, and you have full confidence in his love for you, and that he will treat you with kindness and due respect, and you truly love him—why then you need not ask any more. But I am puzzled to understand how a man of judgment and culture can really *love* and *respect* a woman who does not know enough to be a competent judge in the matter of the ability to have a comfortable house to live in, or a comfortable buggy to ride in—if she is posted in the financial affairs of the firm as she *ought* to be, and has a *right* to be.

But we will now consider the proposition, and wait the result. He says the "home" is *his*, and in consequence of his "masculine supremacy" he alone is not only *qualified* to judge of the necessity or propriety of any change about the wife's residence, but has the sole *right* to make or not make changes.

Soquel, August, 1876.

"RACHEL'S" SENTIMENTS APPROVED.

Mr. Editor: Please give my regards to "Rachel A. Ely," Mrs. or Miss as the case may be. She has told us a valuable truth, and told it well. No one can wilfully violate a physiological law without violating, at the same time, a moral law.

A man has no more right to destroy his constitution by slow degrees than he has to do it by suicide outright. Chewing and smoking tobacco and eating opium, for example, are only species of slow suicide, moral and physical—certainly deteriorating both mind and body during life, and cutting off many days at the close.

I have seen men who would shudder with holy horror at the thought of a little needed work on the first day of the week—which the Lord never commanded to be kept holy—and yet thrust great quids of the nastiest of all nasty weeds into their mouths and masticate them with the zest of one enjoying religion.

Now, the use of tobacco tends to induce general debility, making the body a ready prey to all the diseases to which the human system is liable. To use it is, therefore, a sin; and he who does so, however loud he may be in his professions of religion, is a sinner, and can hope for salvation only through the abundant mercies of God.

Look out there in the street. See a half dozen little boys with cigars in their mouths. Others than they, in this case, are sinners. If the parents and instructors of these children had done their duties to them, they would not have contracted this suicidal habit. It is morally and physically impossible that these shall ever be fully developed men. They can never be what they might have been. Debilitated, diseased, they must of necessity be. Growing old before their time, they will be superannuated at fifty, and die of senility when they ought to be in their prime.

Are not that father and mother sinners who have permitted their children to use tobacco before they have arrived at the age of accountability?

I this day passed the doors of a Sabbath-school, and saw a dozen young urchins puffing away at their cigars preparatory to their religious exercises. What have the Sunday-school teachers been doing, that they have not taught them that it is a sin to defile "the temple of the living God?" Nemo.

San Jose, Sept., 1876.

CHILDREN AND PETS.

BY BUSY BEE.

I wonder if parents, as a general thing, realize how important it is to cultivate and encourage a taste for pets in their children. Every child should own some special pet—a dog, cat, calf, cow, horse, or even a chicken, anything it may fancy—and be taught to take care of them and to be kind and gentle with them, and on no account be allowed to strike or scold them. My little boy has a dog, of no particular value, at the same time we would not take a good deal for him, because the child is so attached to him. At first, as children will, he would get angry at the dog for not minding, perhaps, and strike him. But I make it a point never to allow a child to strike an animal, and by telling him how bad his dog would feel to have him scold or whip him, and that we must try to make all dumb animals love us, he now thinks it would be dreadful to abuse the poor animals that cannot talk, and he notices the least cruelty in others. Only teach our boys to be tender-hearted, and to love dumb animals, and I think it will have a beneficial influence all through their lives. The same rule works as well with girls, only I think they are naturally more gentle and thoughtful than boys. But let them all have pets, and plenty of them, and teach them to love them and care for them. We make pets of everything on the place. Each cat has some particular trait that is noticeable, and our horses are all individuals, and each dog has his peculiar way. If your little boy or girl brings a poor, forlorn kitten or puppy that they have found to you, expecting your sympathy, do not say, "Oh! the nasty little thing! Go take it right straight back; I can't have any cats or dogs under my feet," and see the poor child gather the scrawny, forlorn cat or dog up in his arms, and with eyes full of tears, and aching little heart, take the beautiful pet (beautiful to them) and carry it sorrowfully back. But, on the other hand, put up with the bother—if indeed it is a bother—and say, "Oh! poor little doggie! He shall have a good home, and we will feed him so nice, and he shall not be abused." In short, make your child happy by your own earnest sympathy and interest, at the same time cultivating a regard and sympathy for helplessness in every form.

San Jose, Sept., 1876.

CLEANINGS.

BY HELENA.

Dear Editor: It may be interesting to your readers to know some of the hardships of life so patiently endured by many of our women. In this Centennial year, when the question of womans' equality with man is being discussed freely, and the rights of women as law maker and voter has, to many minds, become a settled matter, it would be well to enquire into the reasons for such convictions. In the course of

A DAY SPENT IN CANVASSING

for your excellent journal, I found ample proof to convince the most skeptical of the one-sided arrangement of affairs at the present time. Mothers with children clinging to them, told me, with tears starting to their eyes, of their harrowing circumstances. Of their husbands who were once thrifty and prosperous, now passing their time at the grog-shop; and when remonstrated with for bringing themselves home in such a plight, made the flimsy excuse that the liquor cost them nothing at all, as the liquor dealer was a good friend and was grateful for past favors. No thought was given to the needed

BREAD AND BUTTER FOR THE FAMILY!

No new clothes for the once attractive wife and growing girls. The mother had been self-supporting as a girl, and with money in the bank, she laid her hand in his, promising to love, cherish and obey till death. The burden of that promise was beginning to be felt; and what but despair in the future for such a heart? At every turn the open door of a saloon to entice one to enter where boon companions made the time pass pleasantly, and all care banished away. What matter if the sad-eyed wife sat sewing by the lamplight to bring food to her hungry family, he was having a good time, and, when hardly able to stand alone, he crept home and to his bed to sleep away the effects of the miserable liquor.

Turning with a saddened heart from such a picture of man's degradation, I enter a neatly painted cottage, and the opening door disclosed to my view a glimpse into such a home as

TEMPERANCE AND INDUSTRY

only dwells in. Entering into conversation over the merits of the Agriculturist, I chanced to remark upon its sound principles of temperance reform, when the lady, with enthusiasm, exclaimed: "That's the paper for us! You know my husband, who used to lounge away his time at the saloon and come home at all hours of the night. Well, thanks to the good Champions, he is now all right. We sit together in the evening, after the children have gone to bed, and talk over the old times, and I know he will never go back to them. See he has paid for our home and built a house on the end of the lot, which is rented to a good tenant. He tells me he was never so happy before as now. Yes, we must have the paper, and I wish all the world could know the joys of life with a good, temperate man."

When I meet with such a case, Mr. Editor, I feel it a duty to place it before the people that all may believe that reform can be accomplished.

A SATURDAY-EVENING REVERY.

FROM M. E. T.

Supper is over the last pot and pan neatly washed and set away. With tired feet I seek the plain little sitting-room, and sit down to meditate. I do think if there is a class of people on this earth to be pitied, it is that class denominated "poor, but respectable." To some this may appear a strange way of thinking, but those who have experienced the troubles and trials belonging to this class will certainly agree with me. I ask, what does the effort cost us to imitate our more fortunate friends, those with whom we associate and who—apparently, at least—regard us as equals? We must dress as nearly as possible as they dress; to return their hospitality we must load our table with delicate viands, and to enjoy their visits we must fashion all our surroundings after a style that is *not* our own. To accomplish this difficult task, we not only make of ourselves positive slaves, but do a thousand things that tend to rob our homes and our loved ones of true comfort. Not that I would condemn that innate pride in the human heart, which is right enough and commendable to a certain extent, and without which we would be comparatively worthless; but, rather, by what means are we to *know* when we have just enough? Where shall we place the dividing line that confers on one side all due courtesy to friends, and inflicts on the other side no injustice to ourselves? And, above all, how are we to possess ourselves of that firmness and independence necessary to a course of action? Why will we go on acting for ever against our better judgment, treading a thorny pathway merely to *look* at the roses that bloom for others, giving, O! so much for so little? The majority of us are aware, too, of the evil consequences attending such a course—consequences that I ask some sympathizing reader of the Agriculturist to assist me in numerating, and which shall furnish food for another Saturday night's revery.

☞ Watches of superior and attractive style and make at Louis Chopard's, at very low prices. Something worth your while to look at.

Boys and Girls.

Turn About.

BY ELLA WHEELER.

Turn about, boys, turn about,
Help us drive the demon out;
Turn before you reach the brink
Where so many thousands sink
But ruin, who began
Just like you, my little man.

How? Well, first they strutted round
With cigarettas that they found;
Then, to imitate grown men,
Sipped at liquor now and then,
Interspersing with a "chew."
Now, is not that just like you?

When they grew to man's estate,
Can you guess what was their fate?
Drunkards, loafers, louts, and knaves,
Filling jails and early graves.
Surely you would rather grow
Into noble men I know.

Think, then, think how they began;
Shun their habits, little man.
Turn about, yes, turn about
Ere you grow to be a lout.
Turn about boys, turn about,
Help us drive the demon out.

Suppose.

Suppose, my little lady,
Your doll should break her head;
Could you make it whole by crying
Till your nose and eyes were red?
And wouldn't it be pleasanter
To treat it as a joke,
And say your glad 'twas dolly's
And not your head that broke?

Suppose your task, my little man,
Is very hard to get;
Will it make it any easier
For you to sit and fret?
And wouldn't it be wiser,
Than waiting like a dunce,
To go to work in earnest
And learn the thing at once?

Suppose the world don't please you,
Nor the way some people do;
Do you think the whole creation
Will be altered just for you?
And isn't it, my boy or girl,
The wisest, bravest plan,
Whatever comes, or don't come,
To do the best you can?

OUR CORNER.

SEVERAL letters were crowded out of our corner last month, and so Aunt Polly will be short with what she says, not that her heart is not full of good things and thoughts for her dear ones, but to make room for you all with your nice letters. You will see that quite a number of the puzzles given in previous numbers remain unanswered. Now try to find out as many as you can of them, and what are not found out by any of you will be entitled to premiums, and the answers will be given that you may see which ones have puzzled you all.

Now what have we in the letter bag?

Strickland, Mich., Aug., 1876.

Dear Aunt Polly: I had just given up ever getting my chromos, when uncle Nathan come home from the office with them. I think they are just as pretty as they can be, and I thank you ever so much for them. I have made out two of Tillie's puzzles in your July number. The answer to her second one is "Aunt Polly," and to her third one, "George Washington." I would try to make you a puzzle too, but I am so busy going to school that I don't have time. I have to get my Sunday-school lessons nights and mornings, besides helping my ma and getting my other lessons. Good by.

Lucy Ford.

P. S,—I have a sister 15 years old. She wants to know if she can come in, too. Her name is Jennie. L.

Why, of course; Aunt Polly doesn't want to shut anybody out, big or little, who wants to come into the Corner. The only reason she graded the ages of those making out puzzles was to give the little ones a fair show with those older, that's all.

Mountain Home, }
Mono County, Cal., Sept., 1876. }

Ed. California Agriculturist: *Dear Sir*—Some kind friend sends your valuable paper to my papa. Whoever it is, he will please accept our warmest thanks, and when it ceases to come we will send for it again, if we can raise the money, as we all love to read it, and papa says it suits him better than anything he has read lately.

Well, Aunt Polly, I send answers to two of your puzzles—one is "Maude Charlotte Card Victoria," the other is "Hyacinth." May Sherwin.

Glad you like the Agriculturist so well, May, and that you will contribute to Our Corner. The publishers send the magazine to your father three months at the request of a friend, and will be glad to get your father's subscription.

Natividad, Sept., 1876.

Aunt Polly: I live down here in Natividad. As I did not go to school to-day I looked over the "Corner," and found out Tillie's puzzle. If I take *o* from a city in Nevada it leaves Elk; if I take *r* from a city in France it leaves Hare, and if I take *a* from a city in Norway it leaves what we all should be—Christian. I am just 13 years old, and although not as smart as the President of the United States, I think I am able to write a few lines to Aunt Polly, anyhow.

Joseph Riordan.

P. S.—My father asked me to find out how I could cure figs, and I told him I would write to you and ask your advice.

J. R.

How to cure figs.

The Editor says that the best way to cure figs is to do as the Turks do (not the turkeys) away off in Smyrna. In the first place, the figs must be fully ripe, ripe enough to drop from the tree by shaking. A canvas or cloth is spread under the tree and the ripe figs shaken upon it. It is best to support the spread by tying its corners to stakes to keep the soft figs from mashing as they fall. Only the ripe ones will fall by shaking moderately.

The next thing to do is to have a pot of strong potash lye, very strong lye. Fill an open basket with figs and dip into the lye, holding them immeesed in the warm lye five minutes. The use of the lye is to destroy the skin and natural, ize the acid under the skin, so that the fig, when dry, will be tender and sweet. Figs may be dried without using the alkali, but they will not be so nice.

The next thing, after dipping into the strong solution of potash, is to let them drain over the pot. Then spread them carefully on boards as you would other fruit, taking care not to jam the figs. When night comes, cover so as to keep away the dew. In two or three days, or as soon as the figs are half dry, they may be pressed flat with the hand, and before they get too hard must be packed in layers closely in boxes—the tighter the better. By observing these rules and doing the best you can you may have figs, dried figs, as nice as the Smyrna figs of commerce.

Of course, the large, rich sorts make the best dried figs, as the best peaches or apples make, when put up, better fruit than poorer kinds do. No sugar is needed when packing the figs. The sugar you see in imported figs all comes from the fruit after it is packed in boxes.

Livermore, Sept., 1876.

Dear Aunt Polly: I have vacation now for two weeks. When we had school we tried playing "Dixie," and splendid fun. I thank you very much for telling me how to play it. The answer to Tillie's first puzzle is, Agriculturist. The names of the places are, Elko, Havre and Christiana.

Yours, Mary C.

From Sarah Sallie, of Plymouth, Amador county, Aunt Polly gets a list of rivers and mountains west of the Rocky Mountains. Sarah makes out 713, all classified. She is only 14 years old, and deserves a special premium, so Aunt Polly will send her the "Peasant Girl at the Well," a very fine chromo.

LINDA'S ORPHAN ASYLUM.

by lulu.

Linda lives in the country. She has no little girls or boys to play with, but she has an "orphan asylum." At present, the only inmate is a little white chicken. The old buff hen came off the nest with five little balls of down, but something happened to four of them, and the naughty old hen thought it beneath her dignity to scratch for one chicken, so she deserted the poor little thing, and his innocent life would soon have been over, had not Linda's tender heart prompted her to take care of the orphan.

Every night Chickey comes in for her to take care of him; so she puts him in the chip pail, covers him up snug and warm, and he is soon in the land of Nod. In the morning she is up bright and early, and his contented little peep says he is well tended and fed. It is amusing to see him hopping about his tin plate, eating crumbs and taking sips of water from his little tin dish. If he does not drink often enough to suit his foster-mother, she catches him up and dips his head in the water. In the daytime he runs outdoors, but comes in often to dinner. Linda calls him her "orphan asylum." When he gets older I expect he will bother her mamma so much that some day we will have some nice chicken stew.

Some time I will tell you more about Linda's pets, but if I say too much at once, Aunt Polly's patience will be gone and the little folks will never hear of the "orphan asylum."

MUSINGS OF A '49ER.

by uncle arthur.

It is now nearly a quarter of a century since I first put foot on the golden shore of California. Then but a boy in my teens, lured from home by the bright prospects of a "golden harvest," "I struck out," as the saying goes, ox-gad in hand, with a will and determination to face the tempest and the storm, to cross the dreary desert and scale the mountain hights in order to obtain—what shall I say?—"a pocket full of rocks" in California!

Well, at the expiration of several tedious months, I arrived here, ragged, dirty, bleeding and sore, and if ever I thanked Providence it was about that time. Although not having ten cents to my name, my heart was full of hope.

But if ever man needed the exercise of patience, it was in those times of crossing the plains. And this brings to mind the time when, in spite of my religions proclivities, the "unruly ox" provoked me to profanity.

Many experiences have I passed through since then, too numerous here to mention, but as opportunities offer I will continue my rambles and experiences.

"I'll Pay You for That!"

A hen trod on a duck's foot. She did not mean to do it, and it did not hurt her much. But the duck said:

"I'll pay you for that!"

So the duck flew at the hen; but as she did so her wing struck an old goose who stood close by.

"I'll pay you for that!" said the old goose, and she flew at the duck; but as she did so her foot tore the fur of a cat who was just then in the yard.

"I'll pay you for that!" cried the cat, and she flew at the goose; but as she did so her tail brushed the eye of a sheep who was near.

"I'll pay you for that!" cried the sheep, and he ran at the cat: but as he did so his foot hit the foot of a dog who lay in the sun.

"I'll pay you for that!" cried he, and he run at the sheep; but as he did so his leg struck an old cow who stood by the gate.

"I'll pay you for that!" cried she, and she ran at the dog; but as she did so her horn grazed the skin of a horse who was by a tree.

"I'll pay you for that!" cried he, and he ran at the cow.

What a run there was! The horse flew at the cow; and the cow at the dog; and the dog at the sheep; and the sheep at the cat; and the cat at the goose; and the goose at the duck; and the duck at the hen. What a noise they made to be sure!

"Hi, hi! What is all this?" cried the man who had care of them. "I cannot have this noise. You may stay here," he said to the hen. But he drove the duck to the pond, and the goose to the field, and the cat to the barn, and the sheep to her fold, and the dog to his house, and the cow to her yard, and the horse to his stall.

"I'll pay you for that!" said the man.

—*Nursery.*

LIQUOR AND TOBACCO AT THE CENTENNIAL.

As might be expected, the whisky, wine and tobacco manufacturers and manipulators take great interest in the Centennial show. So long as the sense of the people allows the productions to be classed under the head of "agricultural," so long they will claim respectability and be barnacled upon any and all shows that are gotten up to foster industrial pursuits. Thrown upon their own merits, as they should be, without the support of the name "agricultural,"—a name they are not justly entitled to—they would most likely seek some corner and appear less conspicuously. So long as we live, we will never recognize such debasing business as the manufacture, sale or use of liquor or tobacco as legitimate "agricultural" pursuits.

The effect at the Centennial show is thus touched upon by Geo. E. Waring in the *American Agriculturist:*

If we take out the barrels, bottles, cans, and boxes, which are filled with whisky, rum, gin, tobacco, cigars, starch, tomatoes, etc., we rob most of the foreign exhibits of their crowning glory, and sadly take away the brilliancy of the display that even our own country has been able to offer. This is not the place in which to print objections to the products of the still, the wine-press, or the tobacco field, but to see at least one-fourth of this fine building filled with a dazzling display of cooperage, glass-blowing, and label-printing, is simply absurd. All this part of the show is beneath contempt, and, as an exhibition, has nothing whatever to do with agriculture—the tobacco exhibit is not quite so subject to this criticism. A pyramid of barrels, said to contain whisky, highly varnished, with gilded hoops and ornamental brands, gives one a far less adequate idea of the products of the industry of Canada, than would a simple, printed statistical table, showing the amount of whisky that she produces as compared with other countries. All this sort of thing is a fraud. It pretends to be an exhibition of materials—it is in reality only an exhibition of packages, and packages are not worth sending to a world's fair. Several foreign countries have sent instructive and representative exhibits. Those of Brazil and Liberia are conspicuously so, but with a few notable exceptions of this class, there is more of interest in the exhibitions of Oregon, or Iowa, or Massachusetts, or indeed in Landreth's exhibition of grains alone, than in the whole of those of the great foreign countries. If one is seeking the *beauty* of a display of soil pro-

ducts, no more beautiful example can be found than in the collection of pine cones from California—a collection that surely should find its place in some Eastern museum.

Correspondence.

GARDENING AND FARMING ON KERN ISLAND.

ED. CALIFORNIA AGRICULTURIST: Mentally, I step into your sanctum this evening, and up comes the question "What are you doing on the Island?" O, there is always plenty to do here. We can plant something every day in the year. Squashes planted in August are about to start runners. Some of the potatoes are a foot high, and others just coming up. Beets just up; any time now is good to plant beets. Turnips, peas and beans six inches high. We expect to make a crop, but that green corn only a foot high may not make roasting ears. Early sweet corn is ripe; so with early Marblehead and Turban

SQUASHES.

If any of your readers have never tried these varieties they will never regret sending for a package of the seed to Gregory next spring. Turban is good for custard pies any time after it is large enough. We never use Cymitons or any other summer squash; the Turban takes the place of them all, and of egg-plant also. I have nine kinds of squash on tread. Will report in time.

OF MELLONS,

the rabbits took all except Hardy Ridge. They eat even the vines. One seed of this variety, protected, gave four at one picking averaging 12¼ pounds each. They are good, but not best. Of watermelons, New German comes first; is quite early, but white core; not very good. Ghinney next; good and tender. Peerless, larger and later; the best in quality; rind too thick. Mountain sweet, late, large and fine.

We have plenty of water for irrigation, and it would be in order now to plow for and sow

ALFALFA,

if I had time. What a county for this crop. The hay sells for $4 per ton in the field, and $5 in the stack. Never saw such a place as this for

CORN.

Some planted July 10th has suckers six and eight feet high; that planted early, two and sometimes three ears to the stalk. With those two crops (a barley crop before the corn and pumpkin crop with it), a farmer ought to make a good living here with half the labor required in the East; also at raising pork, which readily sells for six cents a pound on foot; and with a new country and new mines being continually developed, there is not much danger of over-stocking the market. We like

THE CLIMATE.

The only thing we have to complain of is some chills and fever, but we have less of other kinds of sickness, and after over a year's experience I am only inclined to regret the cry of ague kept me away from here so long, and out on the Tulare plains fighting grasshoppers. Now we can bud and graft without a fear of the trees going off with wings. I may have a few facts about my neighbors' fruit trees for next letter.

Yours, I. B. RUMFORD.

HEALD'S BUSINESS COLLEGE,
No. 24 Post Street
San Francisco, Cal.

DESIGNED TO IMPART A THOROUGH English Education, a Complete Business Training, and practical instruction in Modern Languages, Drawing, Telegraphy, etc. It gives to Pupils such a **Business Education** as has made them in demand in the mercantile community, during the past 20 years, in all commercial positions. In addition, students receive a **Thorough General Training,** which fits them for their duties as citizens, and useful members of society. Every young man should endeavor to secure a course of training at this School, whose course of instruction is valuable to all classes. If farmers would have their sons successful on the farm, they should send them to this **Model School of the Pacific,** where they may be thoroughly educated in business affairs, as well as in the English branches. The thorough discipline of this school, and its careful training in correct business habits, are the greatest aid to future success in any calling. Pupils may enter at any time, as each receives individual instruction. Length of course required for finishing the course is about six months. Full particulars regarding Course of Study, Terms, etc., may be had by addressing

E. P. HEALD,
Prest. Business College, San Francisco.

RUPTURE!

Use no more Metalic Trusses! No more suffering from Iron Hoops or Steel Springs! SAN JOSE INSTITUTE

—AND—

BUSINESS COLLEGE.

A Day and Boarding School for Both Sexes.

THE SECOND SESSION OF THE TWENTY-Ninth School Year will commence October 26, 1876.

In acknowledging the kindness of the patrons of this School, the Proprietors desire to assure them that with the increased patronage will be added increased facilities for imparting instruction. They intend that the School shall offer the very best opportunities for acquiring thorough education, both theoretical and practical.

The course of study in the Academic grade is extensive and thorough.

The Business College has no vacations.

Students from a distance will find pleasant rooms and board at reasonable prices at the boarding-house.

The Faculty accept to its fullest extent the growing demand of the industrial classes for recognition in the public educational system, hailing it as the harbinger of a higher and better civilization.

ISAAC KINLEY,

Superintendent of the Institute.

PROCLAMATION.

Chicago & Northwestern Railway.

Is the popular route overland to the East.

Passengers for Chicago, Niagara Falls, Pittsburg, Philadelphia, Montreal, Quebec, New York Boston, or any point East, should buy their trans-continental tickets via the pioneer route,

THE CHICAGO & NORTHWESTERN R.R.

This is the Best route East. Its Track is of Steel Rails, and on it has been made the Fastest time that has ever been made in this country. By this route passengers for points east of Chicago have choice of the following lines from Chicago:

Pittsburg, Fortwayne and Chicago and Pennsylvania Railways.

Through trains daily, with Pullman Palace Cars to Pittsburgh to Philadelphia and New York on each train.

THROUGH TRAIN, WITH PULLMAN PALACE Cars to Baltimore and Washington.

By the Lake Shore and Michigan Southern Railway and Connections (New York Central and Erie Railways):

THROUGH TRAINS DAILY, WITH PALACE Drawing Room and Silver Palace Sleeping Cars through to New York.

By the Michigan Central, Grand Trunk, Great Western and Erie and New York Central Railways:

Through trains, with Pullman Palace Drawing Room and Sleeping Cars through to New York to Niagara Falls, Buffalo, Rochester, or New York city.

By the Baltimore and Ohio Railroad:

Through trains daily, with Pullman Palace Cars for Newark, Zanesville, Wheeling, Washington and Baltimore without change.

This is the Shortest, Best, and only line running Pullman celebrated Palace sleeping cars and coaches, connecting with Union Pacific Railroad at Omaha and from the West, via Grand Junction, Marshall, Cedar Rapids, Clinton, Sterling and Dixon, for Chicago and the East.

This popular route is unsurpassed for Speed, Comfort and Safety. The smooth, well-ballasted and perfect track of steel rails, the celebrated Pullman Palace Sleeping Cars, the perfect Telegraph System, the method of its trains, the regularity with which they run, the admirable arrangement for running through trains to Chicago from all points West, secure to passengers all the comforts in modern Railway Traveling. No changes of Cars and no tedious delays at Ferries.

Passengers will find Tickets via this Favorite Route at the General Ticket Office of the Central Pacific Railroad, Sacramento, and in all the Ticket Offices of the Central Pacific Railroad.

Save $50! Why Pay $85?

Sewing Machines

REDUCED PRICE, $35.

Home & Home Shuttle Sewing Machines

Reduced to Live and Let Live Prices.

THESE MACHINES ARE ALL SUPERIOR to any and all; nice sewers, straight needle, two threads, shuttle, lock-stitch, the simplest and cheapest, and the lightest running first-class machines in the market. To see is to convince yourselves. ☞ Remember, all Home and Home Shuttle Sewing Machines have the Hall Treadle attached without extra charge.

THE HALL TREADLE

For Sewing Machines,

THE MOST IMPORTANT IMPROVEMENT EVER MADE.

It saves labor and preserved health. No more diseases and deaths, side or back aches from using sewing machines. No teaching required. A child can run it. Always starts the right way. Never goes backwards and breaks things. Can be stopped instantly. With it on your machine, you can do double the work you can do without it. Fifty stitches can be made with one pressure of one foot. Approved by the Massachusetts State Board of Health (see official report, 1872), Massachusetts Medical Society, and Massachusetts Charitable Mechanics' Association. The HALL TREADLE is a part of all HOME MACHINES sold by me.

☞ The Hall Treadle can be attached to any other sewing machine. Remember this. We will attach it onto any machine. It will cost you only $12, and will save you a deal of hard work and trouble.

THE HALL TREADLE GRINDING MACHINE

Must be seen to be appreciated. For a Farmer or Mechanic to see it, is to buy one. It is an indispensable article in every house, shop or hotel.

THE HALL TREADLE JIG SAW AND BORING MACHINE

Is an accomplishment in every workshop. The Hall Treadle is applicable to all machinery requiring a foot power—Sewing Machines, Grindstones, Jig Saws, Turning Lathes, Jewelers' and Dentists' Lathes, etc. Send for circulars.

OUR MACHINIST.

In connection with my regular business, I have a fine MACHINE SHOP, for repairing all kinds of machines and like work, and have employed MR. CHARLES C. REDMOND, a Skilled Mechanic, as manager, and am now prepared to repair machines and machinery, make models, etc., on the most reasonable terms, and ALL WORK GUARANTEED.

Something New, Ladies!

Just What You Want for Yourself and Children.

DON'T FAIL to SEND FOR a PATTERN

Comfortable Combination Clothing.

THESE SUITS ARE CALCULATED FOR Healthfulness, Comfort and Convenience, and will fit the most fastidious person. Explanations accompany each Pattern. Patterns of four different styles of Suits are now supplied, viz.:

1—Flannel Combination Suit (shirt and drawers in one) Pattern, post paid, 30 cents
2—Cotton Combination Suit (shirt and drawers), Pattern, post paid.....35 cents
3—Excelsior Suit (waist and drawers in combination), Pattern, post paid, 40 cents
4—Waist and Skirt, close-fitting elegant combination, Pattern, post paid, 50 cents

Nos. 1 and 2 are suitable for children as well as grown people. Nos. 3 and 4 are for Ladies especially.

THESE STYLES OF UNDERCLOTHING FOR Ladies have been found by all who have used them, the most convenient and comfortable, as well as economical of any new in use. Models were exhibited and attracted much commendation at the late Fair.

Patterns can be had by applying to **Mrs. Herring,** east side of Ninth street, between St. John and St. James streets, San Jose, (where samples can be seen), or by addressing

C. C. C. Company,

Box 686 San Francisco.

This reform underclothing has been worn by the Editor's wife and children for the past two seasons, and is certainly superior in points of comfort, healthfulness, and economy of wear and material of any ever invented. They are the invention of a California lady who makes every pattern herself and writes full directions upon each. No family that once tries these styles of clothing will ever go back to the others.

ROBE AND GLOVE CO.,

OF SAN JOSE, CAL.,

Capital Stock $50,000

C. P. BAILEY, President.
JACKSON LEWIS, Secretary.
JOHN W. HINDS, Treasurer

THIS COMPANY is making a specialty of manufacturing all styles of

GLOVES, ROBES, MATS, RUGS,

Lace-Leather and

PEBBLE GOAT LEATHER,

FROM

Angora Goat Skins.

They claim for the gloves

1st. They are cheaper than buckskin gloves.

2d. The skins are tanned with the grain on, and are very nearly water-proof, and when, from long exposure, they are wet, they dry out perfectly soft—as good as new.

3d. For a harvest glove they have no equal.

They also manufacture all varieties of buckskin Gloves and Mittens as good as the best.

The Gloves, Robes and Lace-Leather manufactured by this Company have taken First Premiums in 1876 overall competitors at the Nevada State Fair, California State Fair, and Santa Clara County Fair.

CAUTION.—Certain unprincipled parties are manufacturing gloves from sheep-skins, and stamping the same "Goat Skin Gloves."

☞ Look for our trade mark, stamped in the glove, before purchasing. ☜

For sale by the trade generally.

City Gardening.

SUGGESTIONS FOR NOVEMBER.

We quote from the San Francisco *California Horticulturist* some hints on work for November, which are written by a practical gardener:

"The flower garden has its worst time during November; flowers are then becoming very scarce, and florists have difficulty in procuring sufficient for their customers, though every year this want is becoming less and less, owing to new plants being brought into notice, and a more thorough knowledge being obtained by those in the business, to supply the wants of flower amateurs. Shrubs and trees should now receive a thorough pruning. After the first rains the ground should receive a good top-dressing of manure, and after that a thorough spading. Whatever is to be transplanted should be done at this time.

Dahlias are better out of the ground, and stored away in a dry, cool room.

Greenhouse plants should be watered carefully. Gardeners and others are apt to give too much water during the fall and winter months.

Cineraries, Cyclamens, and Chinese Primroses should receive the attention of florists, in order to have them in bloom at the beginning of January. The best place for them is close under glass. Cinerarias may have plenty of water, if a warm and sunny exposure can be given. Primroses and Cyclamens do better in a partially shaded position.

Camellias require abundance of water as their flowering season approaches.

All kinds of seeds of greenhouse plants and evergreens may be sown in boxes and pots as soon as they ripen. It is much better for seeds to be put in the ground than to lie upon the shelves, especially as without resorting to artificial heat, the autumn and winter months with us are generally more favorable for the germination of seeds under glass.

Hyacinths can safely be planted for greenhouse and window culture. After potting, place them in a dark room for a week or two, and allow them to form roots before the leaves make their appearance.

The vines in graperies must be kept very dry and airy."

To the above we will add a few words. Prune away and clean up all old stalks, dead leaves and rubbish, so that your garden will look neat. Protect all healthy-looking tender plants from frost by covering over with paper, cloth or boxes on cold nights. Don't allow the Calla lilies to get nipped. It will pay to be particular with them. Make a light, ornamental frame out of lathing to hold the covering. You need not remove the frame; if painted green it will look neat. The covering should be put on at night and removed after the air is temperate—an hour or so after sunrise.

Now is a good time to transplant violets and all early-blooming, hardy perennials. If watering is required, apply in the morning, as watering at night in cold weather is likely to chill the plants.

Now is a good season to stir the soil. After a light spading and pulverizing, spread a thick coating of manure on the surface of beds, and cover the manure with an inch or more of sand. This gives a neat appearance, and is much better for the soil than clear manure. In fact, the very best surface dressing is manure and sand. The sand on top, during the rainy season, by keeping the manure constantly moist, facilitates its decay and prepares it for plant-food, so that when the bed is spaded in February it will be in the best possible condition.

Procure gravel for walks now, before the heavy rains. Shelter all tender plants against beating winds, rains and frost, and you will be well repaid for all trouble.—[Ed. Agr.

WINTER IRRIGATION.

In many portions of California the soil is deep and retentive of moisture, and if once filled with moisture will, without late rains, hold enough in store to supply the growth of a crop of grain, hay, or in fact any crop that does not require an extra abundance of water. An abundance of rain during the rainy season, to fill the soil, will always bring full crops upon such lands. Without the abundant rain to fill the soil, if not irrigated, short crops or an entire failure is sure to result. As our rains are so uncertain, and dry years are so frequent, it becomes a matter of serious import to farmers situated upon such uplands to provide against the possibility of failure. It is a matter of "life or death" with them, in a business point of view. While these lands are generally beyond the reach of summer irrigation from streams of running water, they are usually in reach of water courses that in winter almost always run enough to completely flood the lands were it conducted upon them. That it will pay for farmers to combine together, and take out and utilize the waters that run to waste during the winter, any one can convince himself of by sitting down and figuring upon the costs and profits. It is very seldom that there is enough moisture stored in the soil to produce a full crop. There is not one season in ten that a good soaking of the soil would not be a benefit. The creeks in winter are always supplied with surface washings of hills, and the water is filled with rich, fertilizing matters that, if spread upon the soil, will enrich it more than full cropping will exhaust, so that lands winter-irrigated will constantly increase in fertility and the crops be greatly multiplied. If the value of winter irrigation was properly understood, no farmer who could possibly make use of it would rest content until he applied it to his lands: there would be a general co-operation among farmers to secure the benefits at once, instead of the lethargy and the standing in each other's way so often seen in neighborhoods at the present time. We know of instances where the perverseness of some men prevents the developing of measures that would greatly benefit all, and double the productive capacity and value of farms. This matter of winter irrigation should enlist the action of clubs and Grangers wherever co-operation is necessary to secure it. A few examples in a county would arouse all the people in earnest to an appreciation of its value. Our laws should be so modeled that every landowner can demand as his right a just proportion of the waters that naturally belong to it, and no one should prevent him from reaching such stream by the direction approved by the surveyor. The lands and streams should be surveyed and mapped off, showing the limits of the lands each stream is allowed to irrigate, and the district should be associated for mutual work and agreement. This, with suitable provisions of law for local action and government, would be a foundation for such improvement as the enlightenment and enterprise of the people of each district might demand. No farmer of experience and observation will dispute for a moment that great benefit may result from thorough winter irrigation. The land soaked one winter will, with ordinary rains, bring two good crops, as a portion of the moisture is carried over from the first to the second year. Often when there is nearly rain enough to bring a crop, even a partial wetting by irrigation would supply the balance necessary to insure success. At any rate, a proper system once adopted, the dams and ditches once made, the further expense and trouble would be but light, while the results would be grand and surprising to all but such as have fully realized the advantages of such a system. We might enumerate instances where heavy crops were grown from land soaked in winter, while alongside, on equally good soil, there was an entire failure from drouth. But such instances, on a small scale at least, are familiar to every practical farmer on this coast. No argument is necessary to prove the value of winter irrigation. Only a little united action is required to secure its general benefits.

Raisin-making has been shown from time to time to be much more profitable and respectable than wine-making. While grapes for wine have this year sold for $10 per ton, raisin grapes pay a profit on $50 per ton for curing into raisins. And still there are grape-growers who pretend to despise the California Agriculturist for daring to call into question either the profit or the morality of wine making. The fact that their vineyards are generally mortgaged, and they cannot sell wine for enough to pay the cost of the casks in which it is stored, is as nothing compared to the delusion of phantom wealth they expect to see metamorphosed into a reality. They, too, often spoil their manhood trying to save their wine by drinking it. We pity the poor wine-bigot who cannot see, or that will not listen to truthful advice. And, however much enmity we incur, we propose to continue to give expression to our honest convictions.

BEE-KEEPING IN SOUTHERN CALIFORNIA.

BY OUR REGULAR CORRESPONDENT.

Ed. Agriculturist:—There is little to write about in regard to the busy bee, at this time. Nearly all apiarists have cleaned up, and will have but little care or trouble with the apiary till the swarming season comes again. But the careful apiarist will not allow a day to pass that he does not walk through the apiary. A glance will tell him if all is right. How different this from the Eastern States, where *now* the care and anxiety really commences. To winter safely, requires more labor and more devices than we need to run an apiary the year round, notwithstanding the fact that the moth has twelve months in the year in which to depredate. The best remedy for the above mentioned pests that I have found is to keep the colonies of bees strong.

We have a Bee-Keepers' Association, from which great things are expected in the future, it having organized so late in the season that little can be expected of it this year. And here I wish to say I think they have made a serious mistake in organizing as they have; not that they have not good officers, but they had it in their power to elect a gentleman as President who, from a lifelong experience in the apiary, and in the sale of the product of the same, is pre-eminently fitted for the situation, and the Association would have derived great strength and prestige from putting him in that place, and would have honored *itself* more than *him*, and justly recognize their obligations to the originator of the industry on this coast, and would have as their leader the largest owner of bees on this continent.

This morning I was at work in some willows that fringe the margin of a stream near my apiary, and hearing a familiar sound, I looked to see if my ear deceived me; but no, sure enough there was a large swarm in the air, which soon clustered. I examined and found a fine-looking queen, and thinking them worthy, I soon had them in a good hive, and I gave them a lift in the way of a couple of sheets of honey, which sent them to housekeeping rejoicing. I mention this simply on account of being out of season. Jas.

San Bernardino, Oct. 7, 1876.

Ever since this magazine was published we have advocated making a good use of the grape, and have advocated planting vines to produce feed for animals. It will pay on land too dry to produce alfalfa or other succulent feed in abundance. Upland farms, grain farms, can produce enough grapes to feed and fatten, in connection with grain, a good many hogs every year, at almost no cost at all. The hogs will harvest the crop themselves, and the pork produced will bring better returns to the farmer than grain in sacks. Every upland farmer should plant vines for this purpose.

California AGRICULTURIST AND Live Stock Journal.

$1.50 Per Annum.

PUBLISHED MONTHLY BY THE

CAL. AGRICULTURIST PUB. CO.

" half Column	6 00	" "
" fourth Column	3 00	" "
" eighth Column	2 00	" "
" sixteenth Column	1 00	" "

☞ We are determined to adhere to our resolution to admit none but worthy business advertising in our columns, and to keep clear of patent medicine, liquor, and other advertisements of doubtful influence.

The large circulation, the desirable class of readers, and the neat and convenient form, render this Journal a choice medium for reaching the attention of the masses.

Notice to Eastern Advertisers and Advertising Agencies.

☞ Hereafter no proposition for advertising in this journal will be entertained without pay in advance. Our published rates are the standard for all.

EDITORIAL NOTES.

Occasionally a person to whom we have sent the AGRICULTURIST—is behind in his payment, and orders the paper stopped without paying his dues. Of course no honest person will be guilty of so mean an act. Such will we shall place in the hands of suitable persons for collection, and we shall not hesitate to expose all such dishonest delinquents.

New Work on Grape Culture.—We have received from A. L. Bancroft & Co., San Francisco, a volume devoted to grape culture, written and compiled by T. Hart Hyatt. It is a revision of the work by the same author which appeared some ten years ago, and, in a very condensed form, includes a good deal of practical information upon grape culture in California. In some respects it is not as complete as we could desire, but it is worthy of the patronage of the people.

Persons who receive the CALIFORNIA AGRICULTURIST on trial, are especially requested to examine it on its own merits. If you like the magazine and think it cheap enough at $1 50 a year, please order it sent regularly to your address. If you don't want it we would be glad we have no desire to force you to take it. We simply wish every one now acquainted with the journal to see it for themselves, for we know that among all the people there are a goodly number who will find it just suited to their wants.

Steadily our list increases. This month we print 9,000 copies of the CALIFORNIA AGRICULTURIST. We don't want a single subscriber to "go back on us" now. Send in your subscriptions, and continue the best, cheapest, most independent and practical agricultural and household journal in California, and you will never regret it. The next volume will in many respects surpass in worth and attractiveness any of past issue. Send in you renewals, accompanied with the new subscriptions of friends, wherever possible.

The Santa Clara Echo has changed hands within the past month, E. R. Painter, formerly of Colorado, taking charge. The present proprietor has had considerable experience both as a publisher and printer, and brings with him high testimonials from his former home. We are assured no pains will be spared to make the Echo a first-class local and general newspaper, such a one as will be a necessity to every reading man, woman and child in Santa Clara and vicinity. Send your address to the publisher for a specimen copy and be convinced of what we say.

Ordering Frames.—Persons ordering frames for pictures would do well to associate together and order several. It will cost no more by express, or little more, to send a package of several than it would to send one. Send us your orders and we will return estimate of cost; then when we receive the money the frames will be made and returned to you as soon as possible. Should you wish pictures mounted and varnished we will do that also. But any one can do this at home if he will follow directions given elsewhere, and save one-half the expense.

No notice will be paid to returned papers unless there is written upon them the postoffice address of the person returning, so that we can know from what postoffice, as well as from what name, the papers are returned. As the names of subscribers are arranged in our books by postoffices, we cannot know where a paper comes from without the postoffice address. The proper way to do when you wish to stop a paper is to write to the publisher, settle up to date, and order the paper stopped. If it still comes, get the postmaster to notify the publisher, and further responsibility on your part will cease.

Santa Clara Diet Bread.—M. Frank Kingston, the proprietor of the famous Santa Clara Cracker Factory, is making the very best diet bread in the world It is made from pure, unbolted wheat flour, with no grease, no leaven to deteriorate its nutritive purity. These crackers are put up in large or small packages to order, and are sold at only $7 per hundred pounds. This is cheaper than any other first-class cracker made at any other factory. Invalids and healthy people who want a real good diet bread should obtain some at once. We know that they are unsurpassed for excellence, as we are using them in our own family. We speak this gratuitous word for the benefit of our friends.

The subject of co-operation is one that appears to be enlisting more and more the attention and sympathies of the industrial masses. This we are very glad to notice. The more that neighbors co-operate together in getting fine stock to improve what they already have; to procure machinery to put in and harvest crops; to obtain fair prices for their produce, and to provide themselves with necessary stores for consumption at wholesale rates, the better for all concerned. Co-operation on a small scale, and on a large scale, will pay all the time. Our common schools are co operative under the law. The law of human love and kindness should lead neighbors to study each other's good as well as their own.

Frames for Pictures.—Our Santa Cruz correspondent, and others, have inquired as to the price of picture frames. Unless we have the dimensions of the picture to be framed, and know the style of frame wanted, we can give no estimate. But to such as desire our aid we can offer very nearly wholesale rates. We have made arrangements with frame manufacturers so that we can offer the following figures on frames for the "Gypsy Girl," 12x16 inches (persons ordering to pay transportation from San Jose): 1½-inch oiled walnut moulding with half inch gilt lining, 65 cents; 1½-inch oiled walnut moulding with one inch gilt lining, $1; 2-inch gilt moulding frame, 80 cents. The frames are solidly made, nailed and glued. We might offer lower prices on inferior frames, but will send out none but first-class ones. These rates are only one half (or less) than what dealers ask Persons ordering frames through us for any size or style of pictures, will get them proportionately low. We will be glad to serve all subscribers without pay for our trouble.

Pay in Advance.—There are two ways of running a paper. One is on the plan of prepayment, notifying the subscriber when his time is up and stopping unless ordered to continue; the other is to keep on sending and trust the subscriber, unless he orders it discontinued. The first cuts off a good many who would continue, and who would like to continue, but neglect to go to the trouble just then to attend to the matter. The latter hangs on to a good many who intend never to pay at all, and who think it is legitimate to swindle a publisher out of his just dues. We have always aimed to notify our subscribers when their time was up, with the request that they would order the paper stopped if they did not wish to continue. We have now concluded to come down to the bed-rock principle, and discontinue, after notifying, all such as do not pay in advance. We will then know how we stand, at any rate, and our subscribers will know what to depend upon. Hereafter our terms will be either a promise to pay within a limited time, or pay in advance.

The intelligent masses of the working, producing people, want a paper that is thoroughly independent to the backbone; that courts no favors from leading men in any position, whether in politics or out of politics, in the grange or out of it, in rings or out of rings, whether monopolists or anti monopolists; a paper devoted purely and singly to the best interests of the people to whom it goes, one whose sole aim is to be right; that fearlessly works for principle from motives of principle. He who is sure that his paper may be truly classed in this list will most likely stand by it, even should he in some respects differ in opinion from its editor. An independent editor doesn't try to agree with everybody; he only tries to be agreeable, through motives of tolerance and justice, and to stick to the right just because it is right, believing this is the best in policy as in principle. The AGRICULTURIST is the people's paper, if such an one exists or ever existed. We invite the most radical expression upon all subjects affecting the interests of the producing classes. We propose to work for the advancement of every worthy person and enterprise, and oppose every evil that grows out of the selfishness, greed and monopolizing disposition of men. We want the subscriptions of honest and earnest workers everywhere, and are determined to deserve, by our efforts, a wider field and stronger support.

Home Improvement and Home Enjoyment.—The season for selecting such periodicals as are desired for the coming year, is at hand. Every family needs several papers and magazines to give them the variety of choice reading that intelligent minds require in our age of civilization. The education of a growing-up family is aided by a supply of fresh, interesting and useful reading more than in any other way the investment of an equal amount will bring. Young folks are steadier, and less inclined to seek entertainment away from home, when they are supplied with the best periodical literature. There is more real, enlightened enjoyment, in homes where such reading matter is plenty. Every one of the family is benefitted. The social home circle is always enlivened by the arrival of the mail, which is looked forward to with something of expectation that gives a zest to home enjoyments. Don't fail to supply yourself with good reading matter, and, if it suits you, please include the CALIFORNIA AGRICULTURIST in your list.

San Jose Alden-Preserved Prunes. Mr. C. T. Settle, the Superintendent of the Alden Fruit-Preserving Company, informs us that they have this season converted forty-five tons of fresh prunes into fifteen tons of very excellent dried fruit, worth $280 per ton. The cost of fresh prunes at the factory was $1 50 per hundred pounds. These forty-five tons were produced on about ten acres of land, about 9,000 pounds per acre. This, at the low price of $1 50 per hundred pounds, is $135 per acre for the fruit, which pays very well these times. The cost of gathering prunes is less than any other fruit-crop. Straw or sheets are spread under the trees, and the ripe fruit is shaken off and picked up into boxes and taken to the factory, at no greater cost than gathering up so many potatoes, already dug. The market for fresh prunes in the Eastern States is good, and all the finest, above supplying the home market, are shipped in refrigerator cars in a fresh condition. They keep so well that they may be even safely transported in good order in ordinary cars. The Eastern market for cured prunes is mostly supplied by Europe, from whose ports immense quantities are sent to New York, and sometimes sold as low as $5 the hundred pounds, after paying a 15 per cent. duty. The fact that we have to compete with European prunes at such low rates is worthy of consideration, and would seem to restrict our production of cured prunes to our home market. Still it is thought that the superior quality of our California prunes, cured by the Alden process, will demand an advance over the imported prunes sufficient to encourage the business. If prunes can be produced in Southern Europe so cheaply, why cannot they be here also, where soil and climate are so favorable? At any rate, so far, our orchardists have seen no cause for alarm. The demand, at paying prices, is likely to increase with the supply for many years to come, at least.

Poisoning Squirrels.—Mr. W. H. Ware, a large grain farmer near San Jose, has had a good deal of experience in poisoning squirrels, and has been quite successful. His method this year is to poison sweet apples, which the squirrels are very fond of. The apples are cut across from side to side (not from stem to calex) two-thirds the dis-

tance through; then held open with thumb and finger, and what strychnine will rest upon the point of a penknife blade is put into the center and the halves pressed together. The poison permeates all through the apple. The apple is then rolled into a squirrel hole, out of the reach of all live stock, and the work is done. The squirrels will eat and die. Mr. Ware likes this method better than using melons, poisoned. Birds and other animals are likely to eat of the melons, while the squirrels are not so sure to eat of them as of apples. Squirrels like apples at any season of the year, but most when there is no other succulent food, say in September and October. After the grain starts to grow and there is plenty of green feed, Mr. W. finds that squirrels like dry feed best, such as grain. The way he prepares this is to dissolve phosphorus by pouring hot water upon it, and with sugar or molasses and flour, make a thin batter, and pour this batter upon wheat, stirring till each kernel is coated. One stick of phosphorus needs two quarts of hot water, with a handful of sugar and enough flour to make a thin batter. Don't set the phosphorus in water upon the hot stove to melt, but melt it by pouring hot water upon it, in some suitable vessel. There is but one objection to phosphorus. It kills every rodent that eats it, but when they eat but little it acts slowly, and they are sometimes several days dying. Strychnine acts quicker, but is much more expensive. If squirrels poisoned with phosphorus die where hogs can eat them the hogs will be poisoned also. Poisoned grain should be put well into the holes, out of the reach of other animals. When one kind of poison fails of making clean work, try another, and you will in the end be successful.

Poetry.

Virgil's Georgics Rendered into English Verse.

BY PROF. W. H. WYNN.

TIME TO PLOW.

In early spring when from the hoary hills,
The snow dissolves in percolating rills,
And crumbling fallows to the zephyrs yield
The curling compost of the genial field,
Then to the plow I yoke my sturdy steer,
And pressing hard drive deep the glittering share.
That field repays the eager farmer most,
Which twice has felt the sun and twice the frost;
His crowded barns will burst with burdened grain,
Who three times plows and still will plow again.

QUALITIES OF SOIL TO BE LEARNED.

But ere we break the soil we're not know,
'Twere well to ask the winds which way they blow;
The varying tempers of the sky discern,
And modes of culture from our fathers learn:
What tillage suits the habits of the soil,
In what way each rewards the farmer's toil:
For kinds of soil discriminate must grow,
Here grain, there grapes, are best disposed to grow,
This thriving trees to nurseryman will bring,
In that all herbs spontaneously spring.
See how Mt. Timolus saffron odors sends,
In rich supply to earth's remotest ends;
How ivory the wealth of India wields;
And frankincense the soft Sabaean yields;
Nude Chalybs expert in iron works grow,
Epirus fruitful in Olympic mares;
And where on Pontus best the beaver breeds,
Strong-scented castor for the druggist's needs.
These laws and special aptitudes unmixed,
Wise nature bath on certain places fixed,
What time Deucalion from Parnassus hurled
The lifeless stones into a lifeless world,
His mother's bones, as was the prophet's ken,
And forthwith sprang a hardy race of men.
Come, then, your steers, in early season hitch,
And turn the soil if it be deep and rich,
That dusty summer coming on may make
Maturer sums the scattered clods to bake.
But if the soil you plow be thin and light,
'Twere best to make the furrow also slight,
What time you see in the autumnal skies
Arcturus, harbinger of tempests, rise;—
The latter, lest the scanty moisture leave
The sandy soil as running through a sieve.

ROTATION OF CROPS.

Likewise your lands when reapt of harvests clear,
Should fallow lie through each alternate year;
The soil exhausted by the crop it grows,
Demands an equal season of repose,
When hardening 'neath the matted swaed it brings,
From secret sources new and living springs:
Or, with the season, you the crop should change,
And in succession for repair arrange.
The yellow wheat you will not fail to sow
This year, where last the rustling pulse did grow;
The slender offspring of the vetch replace,
The bitter lupine's brittle stalks apace.
These crops of pede the soil to reinstate,
With waving wheatfields best may alternate.
But choose not to effect the favoring turn,
With flax or oats, for those the soil will burn;
Nor yet the poppy, steeped in Lethean glooms,
For it the virtue of the soil consumes;
But if to these the alternate years must fall,
You may with ease to profit turn them all,
If only you will not withhold to cure
The impoverished soil with loads of rich manure,
Nor spare to scatter with a liberal hand
The sordid ashes on the worn-out land.
Thus change of crop the needed rest supplies
The same as when the ground in fallow lies.

The Owd Wooden Plough.

We make no apology, says the London (Eng.) Farmer, for printing thus prominently a song which is still popular among the farmers of certain districts in Derbyshire and Staffordshire. It comes to us through a correspondent who has notions very far ahead of the "owd wooden plough." Our correspondent thinks it is quite time that "wooden"-ness should be got out of the heads of all farmers:

TH' OWD WOODEN PLOUGH.

Up by th' Blake mere o' Merridge, not a long time ago,
There lived an old chap wi' an old wig o' tow,
His name wor Tom Morris, and I'll tell ye how
He made a discourse on an old wooden plough.
Gee ho Dobbin, gee ho Dobbin,
Gee ho Dobbin, gees up and gee wo.

Twor the tenth of October, and the oats wor just ripe,
On the settle he sot, and he smoked his long pipe;
And he thought a long time about this thing and that,
And said, "Tommy, sit down, and I'll tell thee what's what."
Gee ho Dobbin, &c

"These are terrible times, lad; I prithee draw nigh,
And I'll give thee a wringle or two ere I dis;
I can't stand it much longer, it shortens my breath,
These new-fangled notions will soen be my death.
Gee ho Dobbin, &c.

"They're going too fast, lad, I tell thee, a deal;
There's Lord Talbort, o' Ingestre, and Ralph Sneyd, o' Keele,
And Sandon, and Buller, and Mainwaring, and Bill—
Lord! the stuff they've been talking—it makes me quite ill.
Gee ho Dobbin, &c.

"Wi' their bones and their acids, their drills and guhanner,
Thy grandfather, Tom, never farmed i' that manner;
He'd ha' stared hard enough if he'd heard what they say
About boiling o' oil cakes and chopping o' hay.
Gee ho Dobbin, &c.

"Then soughing's a thing as in course they mun hotter,
So the go s mon's depth to get at th' top water,
And they scoop out the dirt wi' a thing like a spoon,
And for tiles they'll he using o' baccy-pipes soon.
Gee ho Dobbin, &c.

"Then they prate o' their carrots, and mangles, and sich,
(As if growin' o' carrots would mak's men rich)
Or hoeing o' turnits and cleaning o' yallows—
Stuff and nonsense!—and growing of wheat without fallows.
Gee ho Dobbin, &c.

"Why, it makes me to laugh; without fallows, indeed—
I think they mun ha' a soft place in their jed,
And what dun ye think they've been doing just now?
Why, they've got up a laugh at an owd wooden plough!
Gee ho Dobbin, &c.

"Aye, an owd wooden plough; and they say, to be sure,
As the wide-awake farmers mun see 'em no more;
They mun all be of iron, and wood there's no trade for;
Why, what do fools thinken as ash trees were made for.
Gee ho Dobbin, &c.

"Talk o' ploughs made o' iron! why, th' next thing they'll do,
As sure as you live, they'll be painting them blue;
Then they've two tits abreast as they call a gee hue;
They may call long enough, but it never can go.
Gee ho Dobbin, &c.

"No! gi'e me a good wooden plough as is strong,
And a good pair o' big sheuls to help it along,
And four long-tailed tits, a mon, and a lad,
And a good steady pace, and it shanner be bad.
Gee ho Dobbin, &c.

Then Tommy, my lad, never heed what they say,
But get thee on still i' thy forther's owd way,
They'll bring all their hogs to fine markets I know,
But stick, while thee lives, to the old wooden plough."
Gee ho Dobbin, &c.

Autumn.

I wonder if oak and maple,
Willow and elm and all,
Are stirred at heart by the coming
Of the dey that lives but fall;
Do they think of the yellow whirlwind,
Or of the crimson spray,
That shall be when the chill November
Bears all the leaves away?

"If die we must," the leaflets
Seem one by one to say:
"We will wear the colors of all the earth
Until we pass away.
No eyes shall see us falter;
And before we lay it down
We'll wear in sight of all the earth
The year's most kingly crown.

So, trees of the stately forest,
And trees by the meadow way,
You are kindling into glory
This soft autumnal day.
And we who prize remember
That more than all they lost
To hearts and trees together
May come through ripening frost.

A Song of the Country.

BY JOHN STUART BLACKIE.

Away from the roar and the rattle,
The dust and the din of the town,
Where to live is to brawl and to battle,
Till the strong treads the weak man down!
Away to the bonnie green hills
Where the sunshine sleeps on the brae,
And the heart of the greenwood thrills
To the hymn of the bird on the spray.

Away from the smoke and the smother,
The veil of the dun and the brown,
The push and the plash and the pother,
The wear and the waste of the town!
Away where the sky shines clear,
And the light breeze wanders at will,
And the dark pine-wood nods near
To the light-plumed birch on the hill.

Away from the whirling and wheeling,
And cleaning above and below,
Where the heart has no leisure for feeling
And the thought has no quiet to grow.
Away where the clear brook purls,
And the hyacinth droops in the shade,
And the plume of the fern uncurls
Its grace in the depth of the glade.

Away to the cottage so sweetly
Embowered 'neath the fringe of the wood,
Where the wife of my bosom shall meet me
With thoughts ever kindly and good;
More dear than the wealth of the world,
Fond pledges with bairnies three,
And the plump-armed babe that has curled
Its lips sweetly pouting for me.

Then away from the roar and the rattle
The dust and the din of the town,
Where to live is to brawl and to battle,
Till the strong treads the weak man down.
Away where the green twigs nod,
In the fragrant breath of May,
And the sweet growth spreads on the sod,
And the blithe birds sing on the spray.
—Sunday Magazine.

Thanksgiving.

The harvest is over; let the farm bell and church bell,
From valley and hill top the tidings proclaim,
Till the air shall be laden with notes of thanksgiving,
And the mountains shall echo the good giver's name.

Throw open the doors of the farmer's great mansion,
And landlord and laborer draw near to the board,
Where fair hands have scattered in tasteful profusion,
The viands the choicest the farm can afford.

And feasting and jest and the half forgot story
And bumper and song for a season have sway,
For the hands chained to toil are for once liberated,
And heart strange to freedom are free for the day.

Let the swains, browned with sun, and with hands hard from labor,
To the shadowy grove with the maid-mates repair;
And bring with them jewels from grain field and meadow,
To set in the crown that the fairest shall wear.

The wheat plume, and oat plume, and sedge and clover blossom,
And sprays of soft meadow-grass showing the green,
Oh, weave them in chaplets, their colors contrasting
The green with the gold, and the gold with the green.

And out of the throng of the brown rustic faces
Let the maidens choose him who was true to the soil,
Whose courage failed not when the battle was
Whose hands are the hardest and broadest from toil.

And to him the choice of the purest and fairest
And here the honor the chaplet to wear,
Oh, tenderly place it upon her fair forehead,
And let it rest lightly upon her dark hair.

And thus clad in beauty, her tresses the shadow
The cut plume the sunshine enlivened with green,
Let the woodland resound with answering echo
Of their "Queen of Beauty" and their "Harvest Queen."

And the dear little children, Oh, tell them to,
Shall take turns at the old iron ball,
And let them take turns at the old iron ball,
Till stroke answer stroke, and the spirit of mirth
Shall wake their sweet laughter from wood-land and dell.

Oh tell it ye bells, till it reaches the city,
Ye quivering wires swift bear it away;
And whisper the word to the indigent millions
And cheer them with hope of a happier day.

For the harvest is full and the great barns are bursting,
Let a million of voices the glad news proclaim
Till the air shall be vocal with songs of thanksgiving,
And the mountains shall echo the good Giver name.

S. B. RUSSELL

Seedtime and Harvest.

As you look on your bounteous harvest,
Give thanks and remember the poor;
A little will bring hope and comfort
And gladness to many a door.
The widow who toils with her needle
To give little children their bread,
The neighbor so sad, empty-handed—
On these let your blessing be shed.

And last, but not least, in your plenty
Remember your work-mates as well—
The patient dumb beast, who so silent
No words of complaining can tell.
And, wider, the circle let number
God's creatures in wood and in field—
'Tis little they ask of your bounty
Out of the harvest yield.

The sheaf of grain when the winter
Is white with the blinding snow,
And weary and faint in the darkness
The little ones come and go*
As they give in the Frosty Northland,
Where the sun is dim and cold,
When the Christmas days are openin
Over the field and wold.

Spring sun, and rain, and frost time
Have made the earth's good store—
Of all men in your plenty
You should remember the poor;
Let the merchant hoard his treasure—
Let the miser watch his store—
The wealth of the fields is given
To lie at your humble door.

MARTHA READ.

*It is the custom in Norway to put up a sheaf of wheat for the birds in the open air everywhere at Christmas time.

The work of the year, the end, draw th near
And we lay our weapons by;
Late we toiled and long, and dull was our soul
While our throats were parched and dry.

The plow and the hoe to the barn now go,
All bright and worn by the soil,
And we leave them so while our crops do grow
To reward us for our toil.

Sheep and Goats.

THE ANCORA COAT INTEREST IN CALIFORNIA.

BY C. P. BAILEY.

BY many the breeding of Angora goats has been regarded as an adventurous and novel enterprise, engaged in mostly by Californians, who are notably on the alert for something out of the line of everyday investments.

As early as the days of Moses we have record of the use of goats' hair in the construction of the curtains of the tabernacle. From that time to the present the Angora goat has occupied the same country and has been the principal source of wealth to its inhabitants. For many years past England and France have very nearly monopolized the trade in goats' wool or mohair. The city of Bradford, England, is engaged almost exclusively in the manufacture of mohair goods. Several of the factories that started years ago with small capital, have amassed princely fortunes, and now have nearly the whole world for customers.

These valuable animals were first imported to the United States in 1848, and taken to the Southern States; and as there were very few common goats in that country, breeders had to rely almost entirely on the imported stock for increase. This proved too slow and expensive an undertaking for any save a few wealthy men. Two bucks from this first flock were brought to California in 1861, and in 1867 several Angoras, including a number of does, were brought here from a flock imported by a Mr. Cheenery of Boston. Since that time the business has grown steadily and become quite popular, and there have been quite a number of importations of pure bred Angora goats.

In California, and in fact the entire Pacific coast, the Angora has found a home very similar to his native country, and as there were plenty of common goats here, the work of in-breeding has gone rapidly on; and now, only ten years since the first pure bred buck and doe arrived in California, there are over 200,000 grade Angora goats, and we are already commencing to export mohair. Many of the high grade goats are producing as heavy and as fine fleeces as the imported pure breds.

The displays at the Oregon, Nevada and California State Fairs this present year, have been by far the largest and finest ever made in America, and the amount of attention they have received from enterprising business men generally, shows that they are steadily and surely winning their way among the solid industries of our country.

The Jamestown Alpaca Mills at Jamestown, N. Y., and the Farr Wool Mills at Holyoke, Mass., are completing sharply for all the fleece produced on this coast, and are paying from seventy-five cents to one dollar per pound for all fleece over five inches long. They manufacture it into an endless variety of the most elegant patterns of ladies' dress goods.

The Angora Robe and Glove Company of San Jose, Cal., though comparatively a new enterprise, find ready market for all their manufactured goods, and are prepared to purchase all the well-cured goat skins offered them.

From the above facts and figures it is evident that the breeding of Angora goats is destined to continue, and to grow into a prominent, permanent and profitable industry of the Pacific slope.

San Jose, Oct. 20th, 1876.

FINE SPANISH MERINOS.

The very large and finely-developed Spanish merino sheep exhibited at the late County Fair in San Jose by Mr. B. F. Watkins, show favorably for this breed. The only objection that has been urged against the Spanish merino, has been its size. They are said to be inferior for mutton sheep; but such sheep as Mr. W. exhibited seem to refute this idea. They were as large as any shown, excepting one pen of Cotswolds. Certainly the finest wool and highest priced, is long merino wool. Sheep-breeders generally prefer them to any other in California where ranges are broad and often hilly. Such fine sheep would be the very best to cross with the Cotswold to make a perfect mutton sheep, and at the same time one that will produce a fine, long, strong staple of wool. As the ranges become smaller, and as farmers generally get to keeping small flocks, there will be an increased demand for heavy sheep. It will also pay any sheep-owner to obtain the best stock to improve his sheep and increase the quantity and value of his wool product.

LETTER FROM KERN ISLAND.

ED. AGRICULTURIST: I wish I had the last number of your journal before me, but no, it has gone—been loaned out; wish I could subscribe for half a dozen numbers to send around, and keep one on file, or, better, wish *everybody* would subscribe. A lady to whom I took the last number remarked, "Why, it is the best paper I ever saw—so much more in it to read worth reading than in any of my other papers; and the receipts are so good." You hit the nail with that editorial on the cause of hard times, and no hope from either of the principal parties. They are both rich men's parties. When will the working men learn to put up and vote for men who will represent *labor* as well as *capital?*

But I was to tell your readers of Mr. Stine's place, that they may have some idea of what can be done on this Kern Island. Himself and wife came here with almost nothing eight years ago, took up 160 acres pre-emption, and went to work on it, set out willow fence posts which are fine trees now, from which posts enough could be cut to fence more than half a dozen farms; grape vines planted have made a fine arbor; some of the Rose of Peru in the vineyard nine feet apart, I am told produced one hundred pounds of fruit last year to the vine, which sold for six cents per pound. Last winter he grafted many of the mission vines with Muscat and Malaga; some by cleft graft and others by boring a hole in the stock and driving the new cutting in; both did well. From one strawberry plant in the garden there now have an acre. Lawton blackberries do well. Peach trees are large, healthy and vigorous, most of them seedlings, but all producing heavy crops of large fruit. Apricots and nectarines grow to perfection. As to pears, I never saw them do better, the trees breaking down with the crop, and though it has often been stated we could not expect apples to do well in this warm climate, his place proves this a mistaken idea, for they do as well as in Pennsylvania or New Jersey, the same old kinds. I ate an early harvest apple there, that by its flavor, carried me right back to Jersey. Plum trees, most of them, have also done well, but on one tree the fruit shriveled when half grown. A few almond trees did well enough last year to show they are at home. Mr. S. cultivates the land between his trees, raising potatoes, pumpkins, horse-radish, beans, tomatoes, pepper, etc. He has a good alfalfa patch, takes horses to pasture, and has plenty of hay, does not waste the manure, but applies it to corn land and thinks this pays. Now I have neglected to mention the figs, walnuts, and the lady's flowers. She delights in the beautiful, and it needs a poet to describe the surroundings of her home.

J. RUMFORD.

October, 1876.

THE RAINFALL.

The following is the rainfall to date, measured by the gauge at the Bank of San Jose:

September 16	.01 inches
" 29	.09 "
Total for September	.10
October 16, 12 M	.25
Total for October	.25
Total for the season	.35

Two days drizzling wet weather threatened serious damage to the ungathered grape crop. But fortunately it cleared up and dried away the wet before the grapes commenced to rot.

Price of Wheat.—It is a safe rule to go on, to hold wheat or other grain for a raise when it is selling below an average price; particularly when there is not an over supply produced. This year all authentic reports agree that there is not an over production for the markets of the world. Two cents per pound is not quite an average price. For the last ten years wheat has averaged over two cents in San Francisco. The late indications of a war between Russia and the balancing powers, over poor, rapacious Turkey, promised a rapid advance in prices. Notwithstanding present fluctuations, it is safe to calculate that wheat will be two cents before the end of six months.

We Fully intended to write up something in reference to the conducting of State and County fairs this month. The gamblers have had it all about their own way this season. When we get cooled down over our disgust for the whole contemptible humbug, we will endeavor to treat upon the subject.

The Statistician, published by L. P. McCarty, San Francisco, we find to be the most reliable book of reference that we get. It is in the form of a neat little book, published monthly, only $2.50 a year. Single copy, 50 cents. It is worthy your examination.

Three Months on Trial.—There are thousands of persons in California who only need to see a few copies, of the CAL. AGRICULTURIST to become subscribers. We want our friends to send us as many names as they can. The following letter from a gentleman in Southern California will show you why we desire to place the paper before the people. It will bring us new subscribers without sending out drummers, who take the lion's share of proceeds;

LABALLENA, OCT, 15th 1876.

CAL. AGRICULTURIST PUB. CO.: *Gentlemen*—Inclosed please fine 10c for the CAL. AGRICULTURIST three months on trial; should prefer the Numbers Oct. Nov. and Dec. I was reading the number for Sept., with which I was much pleased. I like its wholesome straightforward tone. If you keep it up as good, I shall subscribe for the coming year.

Yours Respectfully.

Tools for the Farm.

There is no better way for a farmer to invest a few dollars than by buying a few tools for the farm. Much time and expense can be saved by repairing broken farming tools yourself instead of carring them to a carpenter and paying a high price for a job which perhaps you could have done as well if not better yourself, and at a cost of less than one quarter the price paid for the work. There are many days of leisure in the early part of the winter that you can devote to the overhauling and repairing of the farming tools to be used early in the spring, and have them in prime order when the hurry of spring work begins. Supposing you have a broken rake handle; instead of throwing it away, lay the head by, or if you have an old handle, put that into the good head and you have a whole rake that will last you as long as a new one costing thirty cents. If you break a pitchfork handle, don't buy a whole new fork the next time you go to town, but buy a handle and put the old tine into it and you have as good a fork as can be bought, and for less than half the cost of a new one. Look about your buildings and note the improvement you could make to guard against the cold of the coming winter, both for your family and stock, and you will see that a few dollars expended for a few well selected tools will be a paying investment.

We would suggest the following tools, all of which are first class and can be had for the annexed prices.

1 Cut-off saw	$2 25
1 Rip "	2 50
1 Jack plane	1 25
1 Short jointer	1 50
1 Square	1 75
1 Hammer	1 00
1 Draw shaves	1 25
4 Chisels	3 00
1 Mallet	50
1 Brace	2 00
1 Screw driver	40
1 Oilstone	1 00
2 Gimblets	15
2 Augers 1⅜ and 2 inch	3 00
6 Bits asst'd	4 00
1 Wrench	1 25
Total	$26 80

Probably, if one went with the cash in hand, the tools could be got for $25,00 or by taking a cheaper grade, for $20,00. With what are enumerated above, a man could make anything from a house down, while nothing that needed repairing on the farm in the way of woodwork need be taken away, and in all probability the value of the tools could be saved inside of two years. It will pay you all, *well*, to make the investment, especially if you have any boys old enough to learn. Let them use them, directing their efforts at first, yourself. By a little showing they will soon learn to handle tools skillfully, and gain a knowledge that may be as useful to them in after years as farming itself. Encourage the boys. Don't catch them by the coat collar and jerk their breaths away if you happen to find them "fussing" to make a trap for rabbits, chickens or the like, but speak kindly and show your interest in their welfare by "lending a hand to help them."—EX.

ARREARS.—Subscribers who are in arrears are reminded that this is the season when a farmer can pay up and should do so. As our circulation increases so do our expenses. Send along your arrearages and subscribe for 1877. Send the amount at once, and a new subscriber for the coming year. It is expensive to send out agents, and we cannot afford to do it. Whether you get bills or not, please remember us.

Horticulture.

BEST FRUITS FOR AN ORCHARD.

A LIST of the best varieties of fruits to cultivate in California for a family orchard is something of much value to every owner of a home. The long experience of many of our best orchardists, and the many expensive changes they have been obliged to make to get only the varieties best adapted to our climate, have resulted in much positive knowledge upon the subject that, when properly reduced and arranged, becomes invaluable information to guide the inexperienced and aid each in making suitable selections of fruits for his locality. For the past three years we have given a list each season, obtained by careful and direct inquiry and investigation. Next month we shall present a revised and very complete list, worth to any one who thinks of planting trees for profit or for family use, much more than the subscription price of the Agriculturist. In the meantime such persons as want information upon any particular point upon the subject are invited to send in questions that they may be seasonably answered. The Editor has had much experience in orchard and nursery culture, and feels a deep interest in such matters. The advice we may give will be founded in the experience of several of our best orchardists, and we shall aim to give only what may pass as authority upon the subject.

Sending Plants by Mail.—Plants of almost every kind may safely be sent by mail if properly prepared and packed. The cost of postage is one cent for each ounce weight. An Eastern exchange gives the following advice:

If we were going to send a small package of trees or shrubs by mail, we should first cut off every leaf about half an inch from the bud, and thus prevent all evaporation of the juices of the plant through the leaves. The neglect of this precaution would alone be sufficient cause for failure, as the leaves, if not also enclosed in some kind of damp packing, would soon dry out all the moisture in the roots, tops, and packing material. After removing the leaves, we would next cut off all surplus wood. If the plants were blackberries or raspberries of the present year's growth, they would be worth more with the tops almost wholly removed, than if left on. Then trim off all long, straggling and broken or bruised roots. Next dip the whole plant in a paste made of clay mud just adhesive enough to form a thin coating for the roots, then roll the package of plants well tied together, in a thin covering of damp, not wet, moss from a wet meadow; then roll all in a piece of strong, brown paper previously coated with linseed oil, which would protect the plants from drying out or wetting other matter in contact. Then enclose the whole in a thin piece of stout cotton cloth, which would prevent the paper from tearing. In this way, we should expect hardy plants like raspberries, currants, or little elms, to go safely across the continent.

The Semi-Tropical Fruits that are now being cultivated in California are all proving a success. English walnuts, almonds, olives, oranges, lemons, etc., are growing well in all portions of the State below the snow-belt. There are no fruits that are in better demand or that promise better returns. Every farmer should make up his mind to plant a variety of semi-tropical fruits for home use, if not for profit, this very season.

Entomological.

THE WOOLY APHIS.

IT IS becoming quite too common on the apple trees of this State, and orchardists should be seeking and applying a remedy before it is too late. For the benefit of those who may not have noticed this insect on their trees we will describe its appearance and state in what manner it accomplishes its ravages. The tree effected with the aphis will have on the body and lower limbs, near the main stem, little branches of white, downy-appearing wool or fuz. At a distance these white spots look like bits of eider down stuck about promiscuous on the bark of the tree. Upon closer observation it will be noticed that these bunches of down are mostly to be found covering little warts or knots on the bark. If the tree is badly effected these bunches of down may be seen to the extremes of the limbs, but always on rough places or blotches on the bark and at the points where the new growth joins the growth of the past season. To find the insect, take a little stick and carefully push away the outside down and beneath it you will see a bunch of redish-brown insects of all sizes from that of the point of a pin to a full grown flea—all apparently struggling to get a foothold on or a bite at the bark of the twig or tree. Press the stick upon the bunch and what was before a living mass of insects becomes a putrid mass of redish-brown matter. Brush the bunch away with a feather and a raw sore or wound on the bark will be seen where the downy or wooly bunch had been. Follow the body of the tree down to the ground, and even beneath the surface, and bunches of these insects will be found sucking the sap, or life blood, of the tree at every point.

We have seen strong and vigorous growing apple trees so completely covered with these insects as scarcely to have a spot of natural bark upon them, all being a mass of blotches or warts covered with white down or wool: and we have seen such trees just naturally die from want of blood, or sap, to keep up life and circulation. This insect is to the apple tree what the scale bug is to the orange tree. The only natural enemy to this insect that we have noticed is the common ant; and the wool or down with which it is covered seems to be the only means of protection against the ant's attacks. The wily ant seems loth to attempt an attack through the wooly covering, but cautiously seeks an opening or exposed point, and seizes the aphis in the rear and quickly dispatches him.

THE REMEDY.

These insects may be killed in vast numbers by sweeping the body and limbs of the tree effected with a common broom or cloth swab or mop. But perhaps an easier and better exterminator is to dip the swab into a strong soap suds made of whale oil soap. This is said to kill them while it encourages the healing of the wound they inflict on the tree.

The above, from the *Record-Union*, is good as far as it goes. The wooly aphis is quite as bad upon the roots as upon the upper branches. They like a fine, dry, loamy soil, and apple trees growing in such soil are generally the worst affected. When once this insect gets upon the roots it is almost impossible to get rid of it. The roots get covered with excrescent growth, warty and deformed, from the effects of this sap-sucking insect. Various means have been tried to destroy this pest under ground, but so far as we can learn, with but poor success. Persons buying nursery trees to plant in orchards should be sure that none of the wooly aphis are upon the roots. Several complaints have been made to us by parties who have bought trees affected by this destructive insect.

The Scale Insect.—Within a few years the orchards in many portions of our State have been badly infested by the various scale insects. Every one of our readers who owns fruit trees is interested to learn how to get rid of the pests. They are especially severe upon orange trees. We quote from a letter in the New Orleans *Our Home Journal:*

"There are several varieties of insects that from some cause or other develop on the bark, leaf and fruit of the orange tree. Some of them are almost round, having a scale covering, in shape like that of the back of a turtle, of a dark brown color. Others are of a yellow cast, and shaped like a common wedge, broad across the shoulder as compared to their length, and others still are of a steel gray color and slender in form. This variety of insect is the most dangerous because it is the most destructive enemy the orange tree has. Many years ago it spread all over Florida, doing much damage; it is there yet to some extent. About the breaking out of the war it made its appearance in the groves on the Mississippi river below New Orleans, also in groves above the city, as well as in the groves on the Upper Lafourche and Terrebonne. On the coast below the city the orchards were nearly ruined by the scale insects, before anything could be found to check their growth and spread.

Various remedies were used. The most effective was tobacco juice, obtained from soaking the stems in water, and applying it through small pumps to the limbs of the trees. Most any alkaline solutions applied as before stated are good. A weak solution of soda, potash or ammonia is good as a wash, or a solution of carbolic soap, thrown through a syringe among the branches of the tree. One of the most simple and the most effective remedies that I have ever seen or known used, is the acids formed by the explosion of gunpowder caused to pass through the head of the tree, either from the explosion of the powder from the top of a board held in the hand under the limbs affected by the scale insect, or applied by a common shotgun. The best time to make the application is while the dew is on the limbs and leaves. Let the powder in the gun be pressed by the ramrod, but no wadding should be used. The party with the gun should stand a few feet from the tree. I tried this remedy on several trees badly affected with the scale insect and removed them all in a few weeks, and the trees commenced a new life and recovered entirely.

Let the powder be exploded among the diseased branches—be sure to do it while the dew is on the tree, or after a rain. The water absorbs to a certain extent the gases of the exploded powder and holds them in contact with the insects; either one of the three principal gases formed by the explosion of gunpowder is destructive of animal life. Try this remedy, we feel assured that it will kill the insects on your trees—at the same time give life and vigor to the trees.

Bark Louse on Fruit Trees.—Most of the experiments made for destroying this insect appear to have been rather unsuccessful. At a late meeting of the Pennsylvania Horticultural Society it was a subject of consideration. T. M. Harvey said, however, that he had succeeded by placing pieces of whale-oil soap in the tops of the trees, from which the disolved matter ran over branches and trunk. J. H. Bartram had cleaned the trees by washing with a strong potash solution in winter. Mr. Sproul had put his trees in fine order by placing a bag of the following mixture in the forks of the trees, namely: two pounds copperas, half pound blue vitriol, fourth pound salpetre, four pounds hard soap, four pounds common salt. Others recommended whitewashing, soap and sand applied with a cloth, fish oil, &c.

Financial Economy.

Not Gold, But Men.

BY RALPH WALDO EMERSON.

What builds a Nation's pillars high?
And its foundation strong?
What makes it mighty to defy
The foes that round it throng?

Not gold, but only Men can make
A people great and strong;
Men who for Truth and Honor's sake
Stand fast and suffer long.

Brave men who work while others sleep,
Who dare while others fly;
They build a Nation's pillars deep,
And lift them to the sky.

PRINCIPLES OF A SOUND FINANCIAL POLICY.

The American System.

THE following extract from a leading journal devoted to the people's interests, we regard as sound and worthy of deep consideration:

1. We hold that it is mainly the money laws of a country that determine the relation of men in respect to property. If laws are just, the men who deserve the property will have it; if unjust, the community by degrees becomes divided into lords and vassals.

2. All paper money should be, equally with gold, a legal tender for all men and all purposes alike throughout the country, except where the laws under which the present contract are made require metalic money to be paid. This is to regulate the bases of money.

3. All money should be convertible at the opinion of the holders, for government bonds bearing a rate of interest not exceeding 3.65 per cent. per annum, and the bonds in like manner to be convertible into money at the opinion of the holder. This is to regulate the quantity of money, and the rate of interest upon it and to prevent monopoly.

4. The paper money of this country should be issued by the government and not by corporations, and the manner of issuing should be by the payment of government expenses and obligations, the same way that all greenback money was issued, and not by short and sharp bank loans, nor loans of any kind. This is to dispense with the useless and expensive agency of corporations in the issuing of money, and to secure the permanent use of the money as such for circulation when its used.

This is what we call the American system of finance, because it will supplement our American theory of equal rights, instead of the ordinary European theory of caste in society. It of course meets the opposition of banks, because it will take from them the privilege of

furnishing and drawing interest upon all the circulating medium of the country, and because it will transfer from them to the government depositaries the larger part of the private deposits of the country amounting to some five or ten hundreds of millions of dollars. The system meets the opposition of government bondholders, because it will enable the people to pay off the bonds in gold, and get rid of the burdensome interest. It meets the opposition of money lenders and brokers generally because it will greatly lower the rates of interest, and establish a cash system of business, leaving very little for the brokerage business to subsist upon. And it meets the opposition of gold gamblers because it will take away the premium on gold. It meets the opposition of office-seekers, because they have learned by experience that the successful way to get office is to be in favor with the moneyed interests; and lawyers are not apt to be in love with it because it will generally diminish the business of foreclosures, forced collections and bankruptcies.

But as to all people except the classes above mentioned, this American system will be greatly beneficial for reasons following:

1. It will make the gold money, the silver money, the paper money and the government bonds all of par or equal value.

2. This par value will establish convertibility of the paper money into gold which convertibility will bring all the benefits and avoid all the terrible disasters of forced specie payment. It will avoid all such inflations and contractions as we have been subject to in the last ten years, and give the people a currency adapted at all times to the legitimate demand of industry and business.

3. It will give constant and profitable employment to all laborers, factories and other productive capital and will at once relieve the millions of starving and perishing men, women and children in our large cities.

4. It will greatly increase the aggregate amount of production, increase our home consumption, home trade, home comforts, and increase also our foreign exports.

5. The increase of our exports will give us balances in our trade with foreign nations, which balances are of necessary gold, thus making gold plenty here, and establishing the true gold basis, (instead of the fictitious ones which we will have if driven on to force specie payment), and thus it will be made just as easy for us to pay government bonds or any other obligations, if desired, in gold as in paper money.

6. It is the only way of purifying our corrupt government, because it is the only way to remove the vast corruption found by which the corruption is carried on, or to take away that great susceptibility of corruption that men have in time of monetary stringency and embarrisment.

7. Under the operation of this American system of finance our people East, West, North, and South, becoming prosperous, will follow eagerly the pursuits of industry, and ceasing from the asperities of the past, will grow into attachment for one another and for the government, and the government will wax strong by this attachment.

We do not believe in any such thing as necessary revulsion or panic in monetary affairs, as taught by our finance doctors. These things are all brought on by corrupt legislation in the interest of money and credit dealers. A country without gold or silver, and even poor in other respects, can have good stable currency adequate for domestic use, and such a currency, will stimulate production and thus bring gold. On the cotrary, a country with the wealth of the the Indias, and gold without limit, will have a poor currency and be miserable if its money laws are vicious and partial. We think the doctrine of over production as now applied to our condition, is abhorrent in the extreme.

RADICAL SENTIMENTS UPON THE SUBJECT.

The *Southern Farmer* gives expression to the following facts and ideas:

HOW DEMONETIZING SILVER ROBBED THE PEOPLE.

The bill which passed Congress, abolishing the legal tender of the silver dollar, was concocted by an "English gentleman," assisted by Boutwell, who was then Comptroller of the Curreney, aided by two of their American capitalists, Mr. Hooper, of Massachusetts, who is a capitalist and money lender, and John Sherman, a tool of the money-power in the Senate, literally stole it through Congress. It was never read in the House of Representatives at all, as the constitution requires, and Mr. Hooper, in response to the inquiries of the members, deliberately lied in the debate upon it. Blaine, by one of his most extraordinary rulings, also helped to put it through a House in which the record shows there were only 123 members present. What was the effect of the iniquitous measure? It increased the value of American securities eighteen per cent., and millions of these were held in England. It compelled not only the Government, but all debtors to pay eighteen per cent. additional to the face of their obligations, and made the bondholders and moneylenders richer by eighteen per cent. than they were before. The "English gentleman," who was sent over to help the American Congress legislate was Ernest Sayd, in the pay of one of the heaviest bankers in Europe, and the bill which he frames for our ignorant or corrupt Congress to pass put nine hundred millions of dollars into the pockets of the European and American capitalists whom he represented. By this legislative swindle, gold was first increased in value, and then the pay of all debts, individual as well as governmental, was required to be paid in gold exclusively.

AVARICE IN LEGISLATION.

Let those who favor the ruinous policy of contracting the people's currency to the gold-standard, remember that it means contraction of the value of all property except that of the bondholders; that it stops business and chills every industry, reducing the number of workmen that are employed at the same time that it reduces the wages of those who still find opportunities for work; that it throws millions of men out of work and deprives numberless women and children of food and clothes, and of everything which makes comfortable; that it contracts the products of the farm and freezes in its cold embrace everything it touches, excepting only the business of the bondholders and capitalist. And all for what? only that a few may riot upon the misfortunes of the many, and add to their hoarded treasure while the great mass of the community are bankrupt as the sequence of the wicked laws made to work out the precise results which have allowed their enactment. It is a fearful responsibility which the money-power has assumed, and some may live to rue the day that their avarice got the better of their humanity, and doomed millions of happy workers to suffer in order that the rich might fatten upon the miseries of the poor.

BONDHOLDERS MERCILESS.

The bondholding class are merciless. They first corrupt all our legislation, and make the laws bend and change so as to promote their interests at the expense of every other class in the country. They order the destruction of the people's money in order that theirs may have freer circulation and yield them higher interest and quicker returns. Then they increase the rate of interest lest they lose their hold upon the people. Then they go a step farther, and having got hold of all that circulates as money, they order that by a certain fixed time their debt shall be paid. They control both political parties, and while all the money is locked up in the banks, they demand that the people shall pay them interest upon their bonds, as if it were possible for people to pay money when they have no money with which to do so. Like the Egyptian task-masters, they order the people to pay interest at the very moment when they have deprived them of the only means by which they could obey their order.

GOLD VS. CREDIT.

There is only three billions of gold in the world, on which is built its vast exchanges of property, and probably not more than half of it is in use, the rest being hoarded. Thousands of billions of dollars of property and products are annually bought and sold on bank checks promising to pay gold. Remember gold and bank currency is only four per cent. of the world's money. They are only Saturday night's wages—pin-money—market money. The great transactions of distributing the world's property and commodities are accomplished by 96 per cent. in checks on banks and bankers. These checks are mostly founded on *bank discounts* of individual notes, *promising* to pay gold or based on gold, but really tossed about and balanced at bank counters, without the movement of a single coin! Four per cent. of coin and currency together, to 96 per cent. of checks, based on the banker's promise to pay gold, which could never be redeemed. What a pyramid of inflated credit!—*Ex.*

SON OF THE SOIL.

The cause or causes of hard times I have not now time nor space to detail, but the remedy is short and plain; it is this: Read, inform yourself; there is nothing like it; knowledge is power; it brings money, influence, place, everything; corrects evil, hard times; crushes errors, humbugs, monopolies; reduces taxation, and pays the national debt. Read your agricultural paper, study political economy, know how your government is managed, study finances, religion, commerce, and make yourselves and your sons well-informed reading men and all will be right yet.—*A. B. Marbury, in Rural Sun.*

FRANCE

Has a currency of over $49 per head; the United States has $13 per head. France paid an enormous war debt in a few months: America has her war debt still hanging over her, drawing gold interest. France made her paper money receivable for all dues, the same as coin; this country excepted "duties on imports and interests on the public debt." The paper currency of France always kept even with the coin; the greenback at times was worth but forty cents on a dollar. France has been wise in her financial policy; we have been criminally foolish. France is prosperous and her people happy; our country is prostrated by idleness, want, wretchedness, bankruptcy, general stagnation and all becoming worse every day.

THE LABORER'S PREROGATIVE.

Because a man sells his strength to you for a given time and for a fixed sum, it does not follow that he surrenders to you his manhood for that time or that he places himself upon a lower grade, socially or morally. He does no such thing. "Circumstances over which we have no control," have ard will compel the best of us to place ourselves in positions, erroneously termed menial, in order to obtain a livelihood, but none of us would consent to subject ourselves to insult and abuse because we were unfortunate. No employer has any moral or legal right to abuse his employee, no matter how humble his station in life may be. No employer should be so blind to his interests as to neglect the comfort, convenience and happiness of those whom he employs.—*Son of the Soil.*

THE RELATIVE DIFFERENCE between gold and commodities is constantly widening with growing civilization. Gold accumulates slowly with all man's greediness, while through machinery and invention, commodities are multiplied with inconceivable rapidity. Soon there will not be one gold dollar for every five thousand dollars required to conduct the world's exchanges, and the relative difference will continue still further to increase. One clear reason bankers want a gold basis is so that they can hold the balance of power against the people and extort unjust tribute for negotiating exchanges.

Ethics.

DOTTINGS AND JOTTINGS.

BY ISAAC KINLEY.

Civility pays. If you ask a person a civil question and he has not the decency to give you a civil answer, he will hardly find in you a ready customer, even though he may have the best wares in the market; and you will hardly advise others to him while their wants may be satisfied elsewhere.

You may be above resentment, and only pity the coarseness that insults you. You may excuse in your own mind—palliating the boorishness by reason of the unfortunate organization and training. I grant that charity is an amiable virtue; but with all your philosophy you love not the man who has not treated you decently, and you are not likely to seek a second insult.

If civility pays pecuniarily, it compensates even better morally. For having done well one becomes himself better. Refinement in action refines the actor. Action reacts; and noble deeds, even from selfish motives, stimulate the virtues they are intended only to semble.

Principles underlie all things, and a single one sometimes explains a thousand phenomena. In the pursuit of knowledge, therefore, this is the chief thing to be sought. A principle once thoroughly fixed in the mind enters into the intellectual processes, and is ever ready for the explanation of new facts or the investigation of deeper reasons. The chain of causation has no missing link. Every fact is a consequence of an in-

finity of antecedent causes and a cause of an infinity of consequences yet to come. The universe is law. Themis sits on the throne with Jupiter to counsel and advise, and the Fates are her daughters.

Every one is a builder—man or woman—who increases knowledge or encourages virtue; who makes the world wiser, or better or happier for his having lived in it. Muscle-work and brain-work—the farmer with his plow, the mechanic with his tools, those who do useful work or give to the world useful thoughts; these are the builders. Increased comforts and better and higher civilization are the results of their combined contributions. Reader, be thou a builder!

Find ten men employed and you shall find at least one as capable as the employer of being at the head of affairs. Should the ten combine to do their own work and sell their own wares, dividing equitably the proceeds—this would be co-operation. The increased wealth and consequent comforts would vindicate the system. How long must the children of laborers go hungry to bed in order to teach the simple lessons of mutual help and mutual reliance?

Diffused light is but darkness; but the concentrated rays of even a winter's sun will kindle a flame. Genius itself, scattering its forces on all subjects, becomes wise in none; while even the plodding mediocre, steadily pursuing one subject, becomes a master. A garden well tilled is more beautiful, and profitable, too, then many broad acres producing only brambles and thistles.

Why respect the good more than the bad, the wise more than the foolish, the just more than the unjust, since each is the outgrowth of antecedent conditions? Why value the perfect fruit more than the imperfect, the golden pippen more than the sour crab, the gold more than the dross? Answer these questions and you will have answered those.

Virtue is a quality not to be boasted of, and he who seeks to parade his own excellence is, ten chances to one, only publishing his own vanity. Virtue is a quality existing for its own sake. He who loves virtue loves it for its own sake, and it never comes in his mind to ask the effect it may have in raising or sinking him in the estimation of another.

In finding the value of character, behavior is the chief factor. What one is is measured by what he does. Rogues, it is true, may put on the semblance of respectability, and hypocrites the robes of sanctity; but in spite of this dissembling the inward self will show outward, and the man find his place.

The mind grows through its ideas. Thought is soul food, and greatness comes of enlarged conceptions of truth. As the barren field is profitless, so is the mind which is barren of ideas. The one produces no bread for the world's eating, and the other no thoughts for the world's thinking.

Read the greatest thoughts of the greatest minds, the purest emotions of the best, and they are only your own thoughts put into language, your own emotions given utterance—the granite of your own quarry hewed into symmetry and polished into smoothness.

San Jose Institute, Oct., 1876.

Hygienic.

Light and Air vs. Drugs.

BY DR. R. M. TRALL.

Mrs. Rogers lay in her bed,
Bandaged and blistered from foot to head,
Blistered and bandaged from head to toe,
Mrs Rogers lay very low.
Bottle and saucer, spoon and cup,
On the table stood bravely up;
Physics of high and low degree—
Calomel, catnip, boneset tea;
Everything a body could bear,
Excepting light and water and air.
I opened the blinds; the day was bright,
And God gave Mrs. Rogers some light.
I opened the window; the day was fair,
And God gave Mrs. Rogers some air.
Bottles and blisters, powder and pills,
Catnip, bonset, syrup squills;
Drugs and medicines, high and low,
I threw them as far as I could throw.
"What are you doing?" my patient cried
"Frightening death," I coolly replied.
"You are crazy!" a visitor said;
I flung a bottle at his head.

Deacon Rogers he came to me;
"Wife is a getting her health," said he.
"I really think she will worry through;
She scolds me just as she used to do.
All the people have pooh'ed and slurred,
All the neighbors have had their word:
'Twere better to perish, some of 'em say,
Than to be cured in such an irregular way."
—[Science of Health.

PRACTICAL HEALTH TOPICS—NO. 6.

BY "JEWELL."

DRESS.

PERHAPS in no one way can housekeepers simplify their work more effectively than in the direction of dress. I speak more especially of underwear and working clothes. It is a singular fact in clothing the body but few regard comfort or health as of any importance, unless it be elderly ladies, who, having outlived the warm blood of their youth, see the folly of not dressing warmly; and to be *comfortable* wear a covering of flannel, without, perhaps, in any other way changing their mode of underclothing.

There are three good reasons why a radical change is needed in this direction:

First—The present style is the most unhealthful manner of covering the body imaginable, which I hold to be the most important reason of all others.

Second—It is the most expensive, taking the most material; and

Third—More time is required in the making and putting on than is necessary.

Especially is this true in regard to the dressing of our children. They are simply victims to the fashions of the day, and our daughters are made sickly women for life from the effects of the half clothed condition of their bodies during childhood. Why our little girl should be only half as warmly clothed as her brother, and made to wear tighter clothes and shoes, is an open question. Or why mothers should strive to keep their girls clean—putting on white underclothing and keeping them in the house—while the boys are allowed full freedom, in thick boots, dark, heavy suits, and are expected to get dirty as a natural consequence of boyhood, is one of the problems for the "coming woman" to solve. In dressing for health, we should strive to have the clothing equally distributed over the entire body. If anything the extremities should be the warmest. This may be done effectually by having an entire undersuit of flannel, or cotton flannel, over which but few skirts are needed; and for work, a short dress, not reaching the ankle, with gymnastic pants like the dress, or of red flannel, would, if tried, be found a most convenient and comfortable change from the present long calico dress, which is dragging into everything and never quite clean about the bottom of the skirt.

Those who have adopted this style of dress can vouch for its usefulness and comfort, and it is far less expensive than the old style. As for looks—we are creatures of habit, and have only to get accustomed to anything to like it, especially if it is convenient and everybody wears it. That is perhaps the greatest bugbear in the putting on of anything different from what custom allows. Most women are sensitive and do not like to be odd. But in the country, as a work dress, it would not meet with many critics, and if a whole neighborhood would adopt it there would be but little to contend with in this direction. In the clothing of children this manner of substituting one suit of flannel, reaching to the ankle, (under the stocking,) and to the waist, with dress and full gymnastic pants either like the dress or of red flannel, would do away with more than half of the present sewing and washing of the family, where there are many children, thus giving the weary mother rest and time for reading, or many pleasures she is now deprived of. The new styles of underclothing, the patterns of which are advertised in the Agriculturist, will prove a blessing to every one who will adopt them. Make the undergarments of warm material, especially for the children.

Remedy for Insomnia. — If much pressed with work, and feeling an inability to sleep, eat two or three small onions, the effect of which is magical in producing the desired repose. Such a remedy has a great advantage over the stupefying drugs commonly resorted to for this purpose, and is ever preferable to the *liquor opii sedat* and chlorodine of medical practice.

How to Deal With Little Accidents. In every home, says the Prairie Farmer, there ought to be a place known to all the members of the household, but out of reach of the children, set apart for things which are likely to be wanted in case of accident. These should include a good pair of scissors, three or four large needles, ready threaded, some broad tape, a little lint, a roll of old linen, flannel and calico, part of each should be torn into strips, some sticking plaster, gold-beater's skin; turpentine, lunar caustic (nitrate of silver), tincture of arnica and tincture of calendula. The possession of these articles will enable any one who can act with self possession and nerve to deal promptly and wisely with most of the everyday accidents to which flesh is liable. These are included in the following list.

CUTS.

Cuts require to be treated suitably according to their position and character. A cut finger is best tied up in a rag with the blood; for blood is very healing. If a cut has any foreign substance such as glass, gravel, or dirt in it this should be removed by being bathed in lukewarm water before the rag is put on. If a cut is severe the blood should be examined. If it is dark, and oozes slowly from the wound, it comes from a vein, and is not serious; if it is a bright scarlet, and spurts out of the cut like water from a fountain, it comes from an artery, and a doctor ought at once be sent for. Until medical aid can be procurred the wound should be tightly bound, and the artery should be tightly pressed above the wound and nearer the heart. If the skin gaps from the cut, the edges should be at once brought to their proper position with calendula plaster. If in a little time it begins to throb, the plaster should be removed, and a rag moistened with calenulated water applied; is useful for wounds where the flesh is deeply cut or torn. If a little lint is soaked in it and put upon the wound, it will in nine cases out of ten prove most beneficial. It is made by mixing thirty drops of the pure tincture of calendula, which may be bought of any chemist, with a half tumblerful of water. A cut on the head requires great care. The hair should be cut all around the place, and lint be dropped in calendulated water and laid upon it. As long as the first dressing of the cut remains firm and gives no pain, it need not be touhced.

STINGS FROM INSECTS.

After being stung by a wasp or a bee, the first thing to be done is to remove the sting. This may be done with a pair of small tweezers, or the sides of the wound be pressed with a small key, and so it may be squeezed out. Then apply to it immediately spirits of champhor, sal volatile, or turpentine, or failing these, rub it with a little common salt, or a little moist tobacco or snuff. If a wasp or a bee stings the throat, a little turpentine should immediately be swallowed. If the place swells very much, and looks inflamed, it should be bathed with arnica, or have a hot white-bread poultice laid upon it. The arnica may be made by mixing twenty drops of the pure tincture with half a tumblerful of water.

The Grape Cure.—The London Garden speaks of the Grape Cure as follows: "There are on the Continent numerous establishments devoted to the application of this remedy two in France, three or more in Switzerland, and many in Germany, Australia and Hungary. The cure is very simple. It consists in eating an immense quantity of grapes. The patient takes but little ordinary food, and is required to eat three or four pounds of the fruit a day at first, the quantity gradually increased at night, ten or even twelve pounds of grapes. This is, if possible, to be eaten in the open air; in the vineyard whence the supply is derived—an arrangement which, no doubt, greatly conduces to the efficiency of the cure." The cure is very simple, certainly, and, we should judge, very captivating; it is not remarkable, therefore, that it should be very popular.

Remedy For Dyspepsia.—A writer in the Medical Journal, discoursing on dyspepsia says:—We have seen dyspeptics who suffered untold torments with almost every kind of food. Bread became a burning acid. Meat and milk were solid and liquid fires. We have seen these same sufferers trying to avoid food and drink, and even going to the enema spring for sustenance. And we have seen the torments pass away and their hunger relieved by living upon the whits of eggs, which have been boiled in bubbling water for thirty minutes. At the end of a week, we have given the half yolk of the egg with the white, and upon this diet alone, without fluid of any kind, we have seen them begin to gain flesh and strength, and refreshing sleep. After weeks of this treatment they have been able, with care, to begin upon other food; and all this the writer adds without taking medicine. He says that hard boiled eggs are not half so bad as half boiled ones, and ten times as easy to digest as raw eggs, even in egg-nog.

Apiary.

Honey Plants of Southern California.

J. W. SALLEE writes to the Anaheim *Gazette* the following on honey plants: You see here in this little valley a variety of shrubs or weed which we call "wild alfalfa." It is very full of bloom, a small yellow flower, and produces a great deal of the nicest honey. And this rough greasewood brush—see what a pretty blossom it has! Bees don't work much on this and these other large flowers you see, the cells being too deep. But this shrub, with a branch of flowers on the end of the twig, of various colors, we call wild buckwheat; it produces a great deal of nice honey.

You see over this mesa a large field of white sage, just coming into bloom. This is our brag honey plant. It will remain in bloom for about seven or eight weeks. All that white bloom you see on the sides of the hills is black sage-bloom. It has been out about four weeks and will remain in bloom two or three weeks longer, and makes a quality of honey nearly as nice as the white sage. But at present the bees prefer the wild alfalfa.

You see all over the hills, and especially in these small valleys, those clumps of bushes. That is the sumac and will bloom in July, continuing for six or eight weeks. It secretes a large amount of honey, but of a red color. Bees gather honey probably more rapidly from that than any other flower. Now take a general view of the hills and valleys; you see, probably, more flowers than you ever beheld before at one view. If there were 100 hives of bees on every square mile of land, I scarcely belive all the honey secreted by these flowers would be gathered. And to think of it all going to waste, just for the want of gathering! It is enough to make a man grow eloquent to stand here on top of this hilt and look at this beautiful mountain scenery—the healthiest on earth—all covered with beautiful flowers, stored with the delicious nectar, and to think that it all, or nearly all, goes to waste for the want of gathering, without any one save a few isolated bee men, to enjoy and appreciate it! Why, sirs, we have the prettiest part of the country. You cannot turn your eyes in any direction but you behold a different scenery—not that monotonous extension of level land of the valleys, but here a beautiful rolling hill, all covered with green grass; there, a rough mountain side, overgrown by rough mountain brush; yonder, a precipitous rough cliff of projecting rocks, each hill alternating with a lovely little valley, with its clear stream of running water. Now, this mountain country is good for nothing much but bee raising. It is true, much of the land could be put to fruit and do as well as the valley land, probably better; but, there should be a bee man on every thousand acres at least, with bees enough to gather thousands of tons of honey now going to waste. Many say, "Is the bee business going to be run into the ground?" I answer, "No!" The honey producing district of California is only a narrow strip on the west side of the mountains of Southern California, extending from Santa Barbara to the State line south. And compared with this State alone it is a very small portion, while compared with the whole United States it is but a drop in the bucket.

Managing Bees.—At the late meeting of the Northwestern Bee-Keepers' Association, the following answers were given by three practical bee-keepers to the questions placed in the question drawer during the meeting:

1. What is the best method of controlling the swarming fever? The free use of the extractor, or by making an artificial colony.

2. Is it an injury to bees to have more forage in the spring than they need for brood rearing? Yes.

3. Is it necessary to give bees light when is wintered in the cellar or house? No.

4. Should bees have ventilation in wintering; if so, how much? Yes, not as much as is generally given.

5. Side or top boxing, which is preferable? Two of the committee were in favor of top boxes, one in favor of both.

6. Which is the better method of swarming, natural or artificial, where box honey is the object, and you wish to double your stocks? Two of the committee prefer natural swarming; one prefers artificial.

7. Which is advisable to produce, box or extracted honey, when you have a ready market for either? Both.

8. Why do bees seal up cracks and openings in the hive? To retain the animal heat.

9. Should an excess of honey be removed from the hive in the fall or in the spring? In the fall.

10. How far apart should apiaries be located? From four to seven miles, depending upon the size of the apiary.

11. Is it important with the Italian bees that the guide combs in the surplus boxes extend from bottom to top of honey boxes? The more comb the better.

12. Why do bees leave their hive about the 1st of May? Discouragement from confinement, mouldy combs, or small cluster of bees.

13. What is the best method of preventing after-swarms? Introduce a young, fertile queen.

14. How should a queenless stock be managed, when the keeper has no queen in the spring? Unite with another stock having a queen,

15. What should be done when in the case of an after-swarm whose queen had been destroyed, and which had been returned to the parent stock, but which persisted in coming out day after day? Destroy queens until all save one is gone.

16. Upon what condition does success in wintering depend? Good stocks in the fall; proper temperature and ventilation; perfect quiet.

17. Is there any sure cure for foul brood save the destruction of bees and comb? Yes, by preventing the brood rearing, by the free use of the extractor, and by smoking the comb with brimstone.

Relative Contents of Different Sized Honey Boxes.—After weighing a great many boxes of different sizes, and figuring it all out, I have found, as a rule, that a box when filled with newly made comb, and the honey well sealed over, will contain three pounds of honey to every one hundred cubic inches of space contained in the box. Thus a box ten inches long, six inches wide, five inches deep, inside measure, will contain three hundred cubic inches of space, and will consequently hold nine pounds, when filled as above stated. This rule holds good with any size of a box, from about twelve pounds down to five pounds. Boxes of the capacity of fifteen to twenty pounds usually contain a trifle in excess of the above estimate, while those of twenty-five pounds capacity, frequently contain two or three pounds in excess.—*Ex.*

California Honey.—We received a call from Mr. Chas. J. Fox, of San Diego, California, who visits Chicago on business for the San Diego Bee-Keepers' Association. The honey interest in San Diego county is a large and rapidly growing one; the estimated crop this year being 500,000 pounds of comb, and about an equal amount of extracted and strained honey. Mr. Fox has samples of both, which we consider very fine. The Association, which was incorporated about three months ago under the laws of California, is a co-operative one, in the interest of the producers. They propose to repack and grade all the honey shipped, affixing certificates of quality to each case, in the same manner as Government revenue stamps. They have a store-house in San Diego where this is done under personal supervision of the officers of the Association. Arrangements have been made for careful handling on steamers and cars, and for through shipment from San Diego to Chicago or other Eastern cities, in carloads, where the honey will be placed in the hands of commission merchants and agents for sale; the object being to sell direct from producer to consumer. The officers of the Association intend to establish a national reputation for San Diego honey, which they believe excels in color, body and flavor any other in the world. There is a very large area of honey-producing territory in Southern California, embracing Santa Barbara, Los Angeles and San Diego counties, and as it can be produced there for less than the materials for making artificial honey can be bought for, the public may be sure that any honey shipped from that region is perfectly pure, and the San Diego Bee-Keepers' Association propose to guarantee all extracted or comb honey shipped by them. Mr. Fox intends to canvass our market and go to other Eastern cities for the same purpose. Such societies as he represents are of great benefit both to producers and consumers, and we heartily wish them success.—*American Bee Journal for October.*

Mr. Harbison has attended the Centennial with a very handsome case of honey. The case alone cost $250. He has 3,000 stands of bees, and they annually produce about one hundred tons of honey.

Fifty Tons (100,000 Lbs.) of Honey.—H. K. & F. B. Thurber & Co., of this city have received the above enormous consignment of honey from one association of California bee-keepers. Verily California does "beat the world" for honey.—*Bee-Keepers' Magazine for October.*

Tree-Planting.—A correspondent in Livingston, Illinois, reports that the planting of trees in groves and shelter-belts, and for ornimental purposes, has become very general in that country. Ten years ago 95 per cent. of the acrea of the county was treeless; but now a farm without a grove is an exception to the general rule. Black-walnut has the pteference for profit and ease of cultivation; but elm, soft maple willow, cotton-wood, European larch ash and common white evergree are popular for ornamental purposes, and occasionally are planted in groves and shelter-belts.—*Agricultural Report for September.*

The Horse.

How Horses are Driven.

BY J. A. C.

To begin, there's your boy, anywhere along from ten years upward, that believes in "making a horse go." Send him on foot and he is in no hurry, but give him a horse and he must leave the road behind him as fast as possible. The whip, if ever applied to himself, he thinks something terrible; but he never thinks the horse has feelings. It is so easy to use the lash that he does not consider the pain it inflicts. A little judicious admonition on the part of parents or others might make many a dumb animal's journey through the world less unpleasant.

Then there's the young man that will needlessly put a severe bit in a docile horse's mouth that he may suddenly check him in his speed *a la* Spanish vaquero. Many Spanish horsemen are exceedingly indifferent to the feelings of the animal they use, and many thoughtless young men will imitate them with as much zest as will children a clown after a circus. The horse is one of the noblest animals, and he will reciprocate kind treatment, coming to have great confidence even in danger when he hears his master's voice. In most cases a bad horse has at some time had a bad master, or has one now.

It is always well to have a whip when a horse is driven, not that he may be whipped, but because he can be better controlled with it when it is necessary. The habit which many have of urging a horse by jerking the bits against his gums is not good. The gums are sensitive, and the pain inflicted by a hard jerk is needless. Every day I see horses pass that are driven by severe jerks on the bits, causing the horse to thrust his nose forward in a very ill position. If a man has any pride about the appearance of the horse he drives he certainly cannot drive by jerks on the horse's gums. I have never seen a trained coachman jerking the mouths of horses, nor do I remember ever to have seen a fine span of horses setting their noses away ahead of them to lessen the force of a jerk from the bits. The owners of such teams are too considerate of the appearance of their horses, and have too much pride in them to see them in so ungainly a position. The moderate tightening of the reins as an intimation of better time may be allowable, but it should not degenerate into a jerk.

Some check their horses by the check-rein till the animal's head is lifted away out of its natural position into an exceedingly uncomfortable one. At this moment one such is passing me with head drawn up as if it was about to crow, but crowing is for the most part a prerogative of roosters.

A little consideration would save a deal of unnecessary suffering and pain; and who really wishes, when he reflects about it, to diminish the happiness of a single being?

There is a grove of over 20,000 ash and maple trees growing near Los Angeles for carriage and manufacturing timber. The trees are said to be in a very thrifty condition.

A Trick of the Trade.

There is not found one gold dollar in all the world for every thousand dollars of bank promises to pay the demand for real gold.

The Dairy.

When the Cows Come Home.

When klingle, klingle, klingle,
Way down the dusky dingle,
The cows are coming home;
How sweet and clear, and faint and low,
The airy tinklings come and go,
Like chimings from the far-off tower,
Or patterings of an April shower
That makes the daisies grow;
Ko-ling, ko-lang, kolingkelingle,
Way down the dark'ning dingle,
The cows come slowly home;
(And old-time friends, and twilight plays,
And starry nights and sunny days,
Come trooping up the misty ways,
When the cows come home.)

With jingle, jangle, jingle,
Soft tones that sweetly mingle,
The cows are coming home;
Malvine and Pearl and Floramel,
DeKamp, Red Rose and Gretchen Schell,
Queen Bess and Sylph and Spangled Sue,
Across the fields I hear her "loo.oo"
And clang her silver bell;
Go-ling, go-lang, golingledingle,
With faint, far sounds that mingle,
The cows come slowly home;
(And mother songs of long gone years,
And baby joys and childish fears,
And youthful hopes and youthful tears,
When the cows come home.)

With ringle, rangle, ringle,
With twos and threes and single,
The cows are coming home;
Through violet air we see the town,
And the Sunset sun is slipping down,
And the maple in the hazel glade
Throws down the path a longer shade,
And the hills are growing brown,
To-ring, to-rang, toringleringle,
By threes and fours and single,
The cows come slowly home;
(The same sweet sound of wordless psalm,
The same sweet June-day rest and calm,
The same sweet smell of buds and balm,
When the cows come home.)

With tinkle, tankle, tinkle,
Through fern and periwinkle,
The cows are coming home:
A-loitering in the checkered stream,
Where the sun-rays gleam and beam,
Clarine, Peachbloom and Phebe Phillis,
Stand knee-deep in the creamy lilies,
In a dreamy dream;
To-link, to-lank, tolinkletinkle,
O'er banks with buttercups a-twinkle,
The cows come slowly home;
(And up through memory's deep ravine
Come the brooks old song and its old-time sheen,
And the crescent of the Silver Queen,
When the cows come home.)

With klingle, klangle, klingle,
With loo-oo and moo-oo and jingle,
The cows are coming home;
And over them on Merrill Hill,
Hear the plaintive cry of the whip-poor-will,
And the dewdrops lie on the tangled vines,
And over the poplars Venus shines,
And over the silent mill;
Ko-ling, Ko-lang, kolingtelingle,
With wag a lang and jingle,
The cows come slowly home;
(Let down the bars; let in the train
Of long-sung songs, and joy and pain,
For dear old times come back again
When the cows come home.)

FOR MILK OR FOR BEEF.

FARMYEN, as well as the common farmer and stock breeder, are interested in the question of breeding "for milk or for beef." Is not the true solution in breeding for *both* milk and beef? The best beef cattle in the world, the short-horns, were derived from a stock noted for dairy cattle. There is yet a class of short-horns that seem not to have lost their excellence as milkers by being improved for beef cattle. It is certainly possible to combine the excellencies of both dairy and beef stock in one; and the nearer the farmer and dairyman comes to doing this, the better. A cow that will produce fine calves, the males of which can be soon grown into fine beef stock, that will readily take on growth and fat, is certainly worth more than a cow fit for nothing but milk. After a cow has become too old for profitable milking, if she can be fattened for beef, and will sell at a high price, it is surely a great advantage. Her heifer calves, fit at once for beef and for milk stock, are more valuable than scrubby looking stock of any breed. The small Jersey's are valuable for hilly farms, where heavy stock cannot run with comfort and safety, also for family use in towns and cities; but on rich valley lands, good short-horn milkers are certainly the best. The same nutrition that produces meat and fat, will produce milk. The beef-making short-horn, while in dairy use, will expend in milk and butter producing, what, if not giving milk, would go to beef producing. In other words, while in use as a dairy cow the strongly organized and capacious power of building up, will be devoted to the elaboration of milk. When she is dry the same force will work to lay on flesh.

We are sure that our dairymen will find it to their interest to cultivate the beef qualities as well as the udder. Either quality *may* be done separately, but it is not inconsistent to combine both the milk and beef producing qualities in one, and thus produce the "coming cow."

Managing Cows In Holland.

From a condensed report of Dr. Starring, in the *London Field*, on the Daily Husbandry in Holland, we make the following extract:

In the dairying districts—mostly exposed tracts of land without a tree—the usual plan of protecting them against the cold and wet is to fasten round their bodies a thick tow cloth, and occasionally a rough shedding is erected to serve them as a shelter. On their return to the stables they are attached by the neck to two stout posts, having movable rings that slide up and down as the animal changes its position. The usual arrangement is for the cows to stand face to face in two rows. Between the latter runs a feeding passage, and behind the cattle there is a channel and plenty of room to remove the droppings. From time to time pea, rye, barley, and oat straw are substituted for a change, and either rape or linseed cake—about a cake a head—is dissolved in the water they drink. Some farmers, however, prefer to give the cake in its dry form, thinking it goes further in that way and is more wholesome. Turnips are not much grown or used as cattle food in the dairying districts; they are occasionally given, however, as a supplementary article of diet, also beets, carrots, white and red clover and spurry; and in the vicinity of towns the refuse of breweries and distilleries is a common feeding material.

The calves are never allowed to suck, and receive for the first four weeks pure milk, after that sour milk, and buttermilk, or whey according to circumstances. At the end of four months the same nourishment is given them as to the full grown cattle; but they often get sour milk, etc., besides. In those localities, such as the neighborhood of Nykerk and Nymegen, in Gueldenland and Veghel, and Breda, in North Brabant, where the fattening of calves is largely and successfully carried on, the usual plan is to put them directly after birth into small pens or boxes, which are just large enough for them to stand up and lie down in and are kept dark. The calves get twice a day as much fresh drawn milk as they will consume, and for the first week each animal is fed exclusively on its own mother's milk. Such importance do some farmers attach to the calves consuming nothing but milk, that they muzzle the creature in order that they may not chew and swallow any of the litter. A calf fattened in the above way will weigh in ten to twelve weeks, fat and lean together, 150 to 200 pounds.

Rearing Stock to Make Good Milkers.

The best method of growing stock to make them most profitable for the dairy has recently been discussed at some length by Mr. A. L. Fish, of Herkimer, in the Utica *Herald*. The pominent idea advanced by Mr. Fish is that in in order to rear cows for "fluent milkers," they should have *succident food* from their birth till brought into milk, which, he says, is usually at two years of age, if the animal is well raised. He argues that the food of a calf, when a change is made from milk, should be cooked and fed warm, or near the temperature of blood heat, because it facilitates a more perfect digestion, for which the distributing functions are in waiting. This position, he says, is fully demonstrated by the fact that in the change from milk to grosser food the young animal shows less thrift, proportionate to increased functional labor required to fit the food for assimilation. The calf adds more weight in growth from a given amount of food it takes during the first week than ever after. The extraordinary size that a calf will attain at eight months old, having been supplied with all the new milk it would take, three times a day, compared with a calf otherwise equal, except that its food is unprepared for ready assimilation, shows it expedient to prepare the food as near as possible for ready distribution in the system, especially for forced growth and for milch cows.

A skillful breeder, he argues, must understand adapting the various kinds of food to develop essential points and fix them by habit in the constitution. The functional relations in the animal organism are based upon the principle of demand and supply. Hence the early exercise of the faculties most essential for practical use.

He would have the animal reared on food that is calculated to stimulate a milky habit, and he would have the animal "come in milk" at an early age, thus educating her from birth for the special purpose of the dairy. Mr. Fish, we understand, has been quite successful in rearing "deep milkers," and his views may be suggestive to those who are growing stock for the dairy.

California Raisins.

The production of raisins in California is rapidly assuming the proportions of an important industry. The grape crop now maturing is probably the largest that the State ever produced, and with an overstocked market, both for table and wine, more than usual attention is being directed to the manufacturer of raisins. It is generally conceded that the growing of grapes in this State at one and one-half cents per pound is a profitable business, and the most experienced producers have demonstrated that this rate can be realized from the crop if it be turned to raisins. Three pounds of muscat grapes will make one of raisins, while the cost of cutting and boxing is estimated at one and one-half cents per pound and if one cent be allowed for freight to San Francisco and commission for selling, we have seven cents per pound as the total cost of production. No good California raisins have yet been sold as low as this, but it is deemed best to keep the estimate on the safe side. At seven cents per pound the California fruit can successfully compete with the imported, and a large business can be done with the Eastern States. The annual requirements of this market are estimated at from 18,000 to 20,000 boxes, the quantity varying somewhat with the price. Last season the receipts of California raisins at this port aggregated 18,000 twenty-pound boxes, and the production of the State reached at least 20,000 boxes. Of this quantity about 6,000 boxes were shipped to New York, St. Louis and Chicago. The best authorities estimate the production this year at 60,000 boxes, consequently a market for about 40,000 boxes will have to be sought for in the Eastern States. If the quality of the new crop comes up to that of the best produced last year, not the least difficulty is anticipated in placing the surplus, though it were ten times greater. The possible proportions that this trade may attain are shown by the imports of foreign raisins into this country, which for several years have ranged from 1,000,000 to 1,300,000 packages, valued at $1,500,000 to $2,500,000, at New York alone.

Here, then, would appear to be one branch of the fruit business open to our farmers, that has not been overdone, and is not likely to be for years to come. The curing of raisins, unlike wine-making, requires no costly appliances. A piece of ground with a smooth surface sloping to the south and provided with movable covering to keep off dews and showers, is all that is required. Indeed, some of the finest raisins brought to this market have been cured upon the ground between the rows of vines upon which the grapes were grown. It is a well-settled fact among the most experienced producers in the State, that however superior machine-dried raisins of other varieties may be, the best raisins are cured by sunshine.—*S. F. Call, Sept. 27th.*

Value of Farm Animals.—According to the Department of Agriculture, the value of farm animals in January, 1876, were as follows: Horses, $632,446,985; mules, $106,565,114; milch cows, $320,366,728; oxen and other cattle, $319,623,509; sheep, $63,666,318; swine, $175,070,484. Grand average as follows: Horses, $64.96; mules, $75.33; milch cows, $28.89; other cattle, $19.04; sheep, $2.60; swine, $6.80. The average value of horses was greater in New Jersey, $110.84; least in Texas, $33.17. Of mules, greatest in New Jersey, $128.32, and least in Oregon, $45.68. Cows, greatest in Massachusetts, $48.33, and least in Florida, $14.62; other cattle greatest in Rhode Island, $49.62, and least in Florida, $8.14. Sheep, greatest in New Jersey, $5.01, and least in North Carolina, $1.58. Swine, greatest in Massachusetts, $18.03, and least in Florida, $2.26.

Flax growing has within the last half a dozen years become quite an important crop in several of our coast counties. The San Francisco Oil Factory has mostly contracted for the crop each year in advance at fair paying prices. We hear some complaint this season from farmers that this establishment is bearing down upon the flaxseed producers so as to discourage them from further cultivation of flax. The farmers look upon the Oil Manufactory as a growing monopoly, and want other market opportunities, new oil mills, or must go at something more remunerative.

The Grain Grower.

Corn Song.

BY J. G. WHITTIER.

Heap high the farmer's winters board;
Heap high the golden corn:
No richer gift has Autumn poured
From out her lavish horn.

Let other lands, exulting, glean
The apple from the pine;
The orange from its glossy green,
The cluster from the vine.

We better love the hardy gift
Our rugged vales bestow,
To cheer us when the storm shall drift
Our harvest fields with snow.

And now with autumn's moonlit eyes,
Its harvest time is come.
We pluck away its frosty leaves,
And bear its treasures home.

But let the good old corn adorn
The halls our fathers trod;
Still let us for this golden corn
Send up our thanks to God.

CRACKED WHEAT AND SMUT.

BY D. A. L.

THE origin of smut in wheat is from cracked grains which have vitality enough to germinate and grow, but not enough to mature the grain.

WHEAT THRESHED ON THE GROUND

By the tramping of horses, and sown without the application of any preparation to it, does not produce smut. Wheat that falls to the ground in the field and makes a volunteer crop does not produce smut. Such wheat, like any other, may blast: that is, for the want of a perfect fructification, a black substance is found in the place of the grain, which blows away before harvest, but the real smut remains in its "sack" till after threshing. Probably the cause of blasting is high winds during the time the growing grain is in blossom.

PREVENTING SMUT.

Since the use of threshing machines became general, every wheat raiser uses quicklime or bluestone, (*sulphate of copper.*) These corrosive substances penetrate the grain where the skin is broken, and destroy the vitality of the fungus germ, and thus prevent smut.

WRONG PRACTICE.

I have known farmers to sprinkle wheat with a solution of sulphate of copper, and immediately apply lime. This method will not prevent smut, because the sulphuric acid unites with the lime immediately, forming sulphate of lime, (plaster of Paris,) leaving the copper in a metalic state, and the last chemical arrangement renders the whole inert.

LIME MAY BE USED

In the manner following: Pour the wheat in a trough, sprinkle and stir till well wet, add lime and stir well. If properly done the lime adheres to the grain like plastering. Lime applied in this way not only prevents smut, but also stimulates the young plants. The dust from lime in sowing is very offensive to the eyes, nose and mouth, for which reason most farmers use

BLUESTONE,

My method of using which is as follows: Dissolve 3 pounds of bluestone in a wooden bucket, using hot water; put 50 to 60 gallons of water in a trough and pour in the solution. Take sacks of wheat and divide them into other sacks to make them convenient to handle. Immerse them in the trough for three or four minutes, then lift them on a platform where they will drain into the trough. Add bluestone and water from time to time so as to use 4 to six pounds of bluestone for each ton of wheat.

THE CRACKING OF WHEAT

By threshing machines can and should be avoided. If the cylinder and concave teeth are adjusted so as to pass at a proper distance, and the grate bars made smooth and free from sharp angles, and the speed kept down so that the grain is not hurled as shot from a gun against the grate bars, the grain would come out in perfect condition for seed. Unfortunately, steam supplies the power, and job work the temptation to make one-twelfth of the crop unfit for that purpose.

Stockton, September 26, 1876.

RICE LOWLAND AND UPLAND.—Louisiana is rapidly outstripping all the other rice growing States in the quantity of production of this cereal. It is thought her crop this year will be over 200,000 barrels, or nearly fifty millions of pounds.

Rice was cultivated along the Mississippi immediately after the French settled at New Orleans. It is said that the first rice raising in America was accidentally procured. A brig from Madagascar on her way to England found her way into Charleston in 1695, and the captain gave a bag of paddy rice to Landgeave Smith, who distributed it, and as it flourished so well, it soon became the prime crop of Charleston and Savannah. We do not think that the French obtained their rice from that source, as their rice was always inferior to the Charleston and Savannah rice, and it is only now that we are getting rid of the evil effects of inferior seed, and of couse a worse quality of rice than our neighbors raise. But it is being done, and the quality of Louisaiana rice is raising the grade every year, and with the vast increase of quantity and improvement in quality, the Louisiana rice will soon command the rice trade of the world.

Flooded or Lowland rice is the kind most rapidly cultivated, and is adapted to the lowlands which can be flooded. The great fields lie along the Mississippi and Latourche, but there are others in the interior where streams may be dammed and turned into lowlands when needed.

The mode of culture in this kind of rice is simple but thorough. The fields are laid off in small slices, which vary greatly in size. There are one or two main canals leading the water as it overflows from the stream to the field; from these smaller canals and ditches conduct the water as wanted into each section. Every patch or small field is laid off to itself with its own ditches and levees around it, and a flood gate at the main ditch to let on the water, and another at the lowest point to take it off. The ground is usually broken well as early in the spring as possible; the rice is then sowed so that it is not likely to be affected by frost; some drill, which is better. The water is let on after planting and allowed to remain until the seeds are well sprouted. It is then drawn off and the rice allowed to strengthen a little, when the water is again turned on and allowed to remain several weeks. Some again draw off the water to clear the field of weeds; others do not, and pull up the weeds, wading in the water to do so. At all events the water is turned on some weeks in advance of the heading, and is always to remain until it is drawn off for the last time to let the grain harden and ripen, when it is cut with the sickle, and not as it might be with the California header.

When cut it is tied in bundles like wheat and shocked in the field until hauled away to be stacked or thrashed.

The whole operation is a simple one, and one hand may cultivate thirty acres.

The yield is about an average of 1200 pounds of threashed rice to the acre.

The *Upland* or *Moundain Rice* is of a hardier kind, and not quite so long in the grain nor as white as the lowland rice. It may be raised wherever cotton will grow, and it is more productive than the watered rice, often gives 1800 pounds of clean rice to the acre. It may be planted from the 1st of April to the 1st of June in this State, and the ground should be as low and moist as can be had to be susceptible of cultivation. It is usually planted in drills, or better in hills. If in drills the rows should be about three feet apart; if in hills the rows should be three feet one way and about fifteen inches the other, so as to admit cultivation both ways.

Thus prepared, the unhulled or paddy rice should be planted at the rate of a peck to the acre, rarely more, as with a good stand it stools more than any other plant. Planted in hills, about four or five seeds in a hill is enough.

It should be worked vigorosly with plow and hoe so as to be kept clean, until it shades the ground, when it will do to lay by. Some three plowings and scrapings will answer. Thus cultivated, it yields enormously in good ground anywhere in the uplands, and will make from fifty to one hundred bushels of rough rice to the acre, in addition to the straw, which, if properly saved, all stock animals eat with avidity.

The rough rice may be thrashed in a wheat thrasher, or even on the bare floor with a flail very fast.

The cultivation of upland rice should be extended.—[*New Orleans Our Home Journal.*

Correspondence.

LETTER FROM SANTA CRUZ.

SANTA CRUZ, Oct. 1, 1876.

ED. CALIFORNIA AGRICULTURIST: It is often a subject of remark that this beautiful little city does not receive more notice in your columns. Is it owing entirely to the remissness of your old correspondent from this place; It is but natural that those making their homes here, should feel interested in having outsiders know the advantage of a residence in Santa Cruz, and hoping others may follow my example and give you occasional notes from their own stand points, I beg your acceptance of a few lines.

This centennial year has been an eventful one for Santa Cruz. The long talked of

NARROW GAUGE RAIL ROAD

Between here and Pajaro has been completed and was opened to the public early in the season, our first class private boarding houses have had to more than double their capacity, by the building of an elegant addition which however proves inadequate for the accomodation of numerous guests who were compelled to seek shelter among private families in the neighborhood, taking their meals in the spacious dining room of the establishment.

SURF BATHING AND PICNICS

Has been the order of the day and the town has been lively with teams and horseback riders, as well as with pedestrians in fashionable attire.

A complete description of the beach during bathing time appeared some time ago in the Sunday Chronicle, and when you consider that for upwards of five months the same scenes have occurred each day with scarcely any intermission, it is not to be wondered at that old residents become accustomed to it and find less novelty and enjoyment there than the new comers.

New houses are springing up and improvements in the way of widening streets and planking sidewalks are in contemplation. The narrow guage road between here and Felton, also completed this year, is in successful operation. The company have built a fine wharf at the beach for shipping the lumber brought from the Redwoods

BY FLUME AND RAIL,

And other improvements are in progress. The work of tunneling under the upper plaza is soon to be accomplished, which will enable the company to send trains by steam close to the water's edge, instead of going through the town with horses as they now are obliged to. In order to accomplish this work as speedily as possible the enterprising superintendents employ three gangs of men who each works eight horse shifts night and day. How the prayers of the devout must ascend to the Throne of Grace from the Church above, for the brethren in the tunnel below, (no Chinamen being employed.) This is

THE TRUE SEASON FOR CAMPING,

As game is plenty and the law no longer prohibits the taking of it. Several parties have already gone, but mostly unattended by the gentler sex, who are often timid in the use of fire-arms. These *stag* parties are by far the most successful and bring in more game, while the ladies prefer cooking it by their own firesides rather than over the camp fire. Though the season is far advanced the daily train comes well patronized, and the company congratulate themselves upon the fact that this peice of road has yielded as large a revenue as any other in the state. Families are coming in to

MAKE HOMES AMONG US

Attracted by the railroad communication as well by the educational facilities, which have also received a fresh impetus in the form of a new school house costing some $20,000. An excellent corps of teachers are employed, who gives general satisfaction. It is one of the necessities of the age to give our youth school education, but mothers who have children growing up more interested in play than study or work, would like to see added opportunities for diverting their attention toward useful employments so that upon leaving school a desire for industry would lead them to obtain situation for becoming self supporting. Your paper continues to be a

GENERAL FAVORITE

Here, and I hear the ladies wondering why the Editor does not always affix the prices to the illustration of articles in the way of plant stands, aquariums and the like which are to be obtained in your city. Also wishing you could advertise prices of frames for chromos, of which every family usually has more than they feel able to frame at prices asked. I find a marked difference in the San Francisco prices of such things and those we are here expected to give, and presume they are less with you.

Hoping you may live to see the day when the CAL. AGRICULTURIST will have become a household necessity, everywhere, alike for the rich and the poor, I close. HELENA.

It is the conscious want of merit that causes one to depreciate the merit of another. Unable or unwilling himself to go up, he would drag all others down.

Porcine.

Hogs And Alfalfa Hay.

JUDGE DIXON, of the Buena Vista Ranch, on the occasion of a recent visit there, called our attention to his heard of 100 head of hogs, which were fed solely on alfalfa hay. They were generaly good stock though none thorough-bred, and all were in fine condition. The hay was hauled daily and fed to them after the first of the January. Some of the finer bred animals were fattened quickly into excellent pork. As the hay cart was seen by them coming to the lot they run to the fence like a lot of calves, and eat the fresh hay with as much avidity. The hay was cut and 500 tons stacked and covered with tule. The experiment of Judge Dixon had its which were origin in the fact of the hogs, running in the alfalfa field, leaving the green clover and feeding daily at the stacks of dry hay. The result establishes the truth of our frequent statements that hog raising on the Island is destined to become the most prominent and productive branch of farming. It would be almost impossible to estimate the possible increase with the unexampled facilities for growing them at a trifling cost. The pork, when made from hay, partakes very much of the character of grain fed meat, is solid and sweet, making first quality bacon and hams. Every farmer will find it to his interest to cut at least one crop from his field for hay fattening of his hogs in the fall.—*Southern Californian.*

Breeding Young Sows.—The practice of breeding from young sows is a common one in all sections. At first no bad result may show, but the practice is a bad one, nevertheless. Common sense is against it, for no animal should be allowed to breed until the carcass is fairly devoloped. The practice should be utterly condemned. If continued in the family for a few generations of swine they will be found to dwindle down from three to four hundred pound hogs to animals that will weigh only two or three hundred pounds. It is much better to keep the sows three or four years, and even much longer. Sows have been kept for fifteen years to advantage. Swine are several years coming to maturity. It is a fact well known, at least to every Irishman from the "ould country," that pigs from old sows will grow some thirty or forty pounds heavier than those from young ones. While shotes are growing, the sows should not be allowed to breed until the live weight will exceed one hundred and fifty pounds.

Keeping Boars.—We read about the care bestowed upon stallions, rams and other breeding animals, but rarely do we ever see a word on the care of boars. They are usually raised with breeding sows, and run and worry and become nothing but ruins. They go days without food. They disappoint their owners and everybody else. Now, it is just as important to take care of a breeding hog as it is of a horse, and a good, snug pen or yard should be used to enclose them. They can be well fed here, and made to grow; and if their services are needed, it is easy to have a door or gate to let breeding stock in. If this plan is followed, one will have a far better stock. The slops of the kitchen, sour milk, vegetables, bran and soaked corn can be fed to him, and he will be a credit to all concerned.—*Rural World.*

Another Premium Essay Wanted.

Editor California Agriculturist and Live Stock Journal, San Jose, Cal.:

The object of the American Berkshire Association is to revise, preserve and publish the pedigrees of pure-bred Berkshire swine; also to collect and disseminate information calculated to advance the interests of swine breeders generally.

In furtherance of a part of its work, and in view of the favor with which the premium essay on the origin, breeding and management of Berkshires was received, the Association has decided to offer another premium of $100 for the best approved essay on the Diseases of Swine, their Causes, Preventives and Remedies. Said essay to be practical and exhaustive. The competing essays to be forwarded to this office on or before the 1st of January, 1877. The award will be made and the money paid at the annual meeting in February following. All competing essays will be the property of the Association.

Competition is invited from all practical men who have given attention to the diseases to which swine are subject. Prof. Law, of Cornell University, N. Y.; Prof. Smith, of Toronto Veterinary College, Canada; Hon. T. C. Jones, of the "National Live Stock Journal," and E. G. Bedford, Esq., of Kentucky, have kindly consented to act as the Awarding Committee.

The premium essay will appear in Vol. II. of the American Berkshire Record, now in course of preparation, the pedigrees for which, as fast as approved and certified, have record numbers assigned them, and certificates of registry forwarded to the parties entitled to the same, in advance of publication in Vol. II. Address,

Sec'y American Berkshire Associat'n,
Springfield, Illinois.

An educated hog at one of the watering places is said to be a good mathematition. No doubt it excels in a "square root," and is also good at "subtraction" when in a turnip patch.

The Pig's Start in Life.—The pig is an animal that has its wits about it quite as soon after birth as the chicken. I therefore selected it as a subject for observation. The following are some of my observations: That vigorous young pigs get up and search for the teat in one, or within one minute after their entrance into the world; that if removed several feet from their mother, when aged only a few minutes, they soon find their way back to her, guided apparently by the grunting she makes in answer to their squeaking. In the case I observed, the old sow rose in less than an hour and a half after pigging and went out to eat; the pigs ran about, tried to eat various matters, followed their mother out and sucked while she stood eating. One pig I put in a bag the moment it was born, and kept it in the dark until it was seven hours old, when I placed it outside the sty, a distance of ten feet from where the mother lay concealed in the house. The pig soon recognized the low grunting of its mother, went alongside the sty struggling to get over or under the lower bar. At the end of five minutes it succeeded in forcing itself through under the bar at one of the few places where that was possible. No sooner in than it went without a pause into the pig-house to its mother, and was at once like others in behavior. Two little pigs I blindfolded at their birth. One of them I placed with its mother at once; it soon found the teat and began to suck. Six hours after I placed the other a little distance from the sow; it reached her in half a minute, after going about rather vaguely; in half a minute more it found the teat. Next day I found that one of the two left with the mother, blindfolded, had got the blinders off; the other was quite blind walking around freely knocking against things. In the afternoon I uncovered its eyes, and it went round and round as if it had had sight and suddenly lost it. In ten minutes it was scarcely distinguishable from one that had had sight all along. When placed on a chair it knew the height to require considering, went down on its knees and leaped down. When its eyes had been unveiled twenty minutes I placed it and another twenty feet from the sty. The two reached the mother in five minutes and at the same moment.—*Popular Science.*

Lice on Swine.—The general cause of lice on swine is uncleanliness in one or more of the departments of swine management. It is very seldom a healthy, thriving pig, one who has been supplied with good food and a plenty of it, and has been assigned comfortable quarters, which are regularly and properly cleaned, is troubled with lice. Sometimes it happens that they get the lice from less favored brethern, and I have them on my herd by bringing them in with a splendid pair of young Berkshires I bought in the West. If lice are left to worry and irritate swine, they do not do as much good as they should on a given amount of food, and it should be the aim, therefore, for all good breeders to remove them as quickly as possible. Our first experiment in removing lice was tried on the above mentioned young Berkshires. We took some common coal oil and poured it along the pigs' backs until it spread over the whole body. We saw but few lice the next day, but thought best to repeat the dose, which was done three times more. The lice of conse, left for unknown parts, but the worse of it was the pigs lost their hair, the sow losing all of it, owing to having too much coal oil. One application would have removed the lice and not injured the pigs. Sulphur and lard rubbed on the pig is an excellent remedy, as is a dose of sulphor in the feed if the weather is warm, as it works out of the skin and proves very unpleasant to the parasites.—Ex.

The Berkshires.—The friends of the Berkshire breed of swine claim:

1st. That they have more constitutional vitality, and consequently are less liable to disease than any other breed.

2d. That they are more prolific, and that the pigs are more uniform in size, color and form, and consequently produce more saleable pigs than any other breed.

3d. That their flesh is finer, firmer, and of higher flavor than any other breed.

4th. That they furnish the finest and best hams, shoulders and bacon of any other breed in the world, and in England their meat brings a higher price than that of any other breed, on account of its superior excellence.

5th. That they are the best breed for the western farmer, being active, seeking their own food, keeping in excellent order on grass or clover, and fattening early and readily on less food than almost any other breed.

These excellent qualities the breeders of Berkshires believe they possess, and they think it is only a question of time when they will supplant the other breeds.

Stock Breeder.

LIVE STOCK FARMING.

LIVE stock farming is the most profitable of any branch of farming. If the majority of our farmers realized the importance of this matter, we feel sure they would do differently and reap the reward of a wiser discresion. In England, where farming is conducted on the most economic principles, and the art and science of farming is most thoroughly understood, it is found that live stock farming pays better than the raising of produce for market. This, where the land is high and where a dense population is to be fed from the soil. How much stronger will the same rule apply to our State, where a surplus of grains are produced at low prices, and where beef and pork are always cash? The Chicago *Live Stock Journal* says that in this country a very large increase in live stock upon American farms would be attended with even greater profits than the English farmer can reasonably expect from the same source. There is not only a general impression among intelligent farmers that this is so, but experience has shown that live stock in some form is the most profitable interest to which the farm can be devoted. Those who make live stock their specialty, devoting to it so much of their resources and attention as circumstances will admit, are the most thrifty and successful of our farmers. And here we are not speaking merely of those who make a specialty of breeding thoroughbred stock to be sold again for breeding purposes, but of the great body of farmers, who produce horses for labor, cows for milk, cattle and swine for the butcher, sheep for wool, etc.; in other words, animals for consumptive purposes. Every ambitions farmer should be alive to such facts as these, and hasten to make the most of knowledge of the principle. Stock farming requires closer attention, to make the most out of it, than any other department. The right number, kind and variety of stock to keep to consume the products of the farm economically, the proper time to fatten and to sell to best advantage, as well as to the breeding and keeping of young stock, all demand proper management. A few mistakes in such matters make a great difference in the matter of profits. The expense of starting into the business may deter many from at once entering into the business; but to start with *young* stock requires little capital, and soon the growth and increase will begin to pay. A farmer should be willing to invest all his earnings for a few years into something that will put him in a prosperous condition and increase the value of his business and farm. In no way can he do this better than in the raising of such stock as is best adapted to his farm, and cultivating the soil to produce feed for his stock. The old style California cattle or sheep ranching over thousands of acres of wild lands, never cultivating a foot of soil for feed, is uncivilized and undesirable. The proper way to do is to produce upon the soil as much good, solid feed as possible, constantly enriching the soil by utilizing the manure. A farm well fixed for stock-raising should be fenced in apartments so that a system of rotation can be conducted, and hay fields, grain fields, vegetable fields and pastures be apportioned as will best suit convenience and prosperity. Facilities for irrigation will treble or quadruple

the amount of produce to the acre suitable for stock feed. Once well fixed for stock farming, the farmer is not only independent but in a way to become wealthy without working himself to death. When grain-growing runs farmers in debt it is time to *think* about making such a change as will prove beneficial.

A NEW AND LIMITLESS OUTLET FOR AMERICAN BEEF.—In our Monthly Report for June, page 203, under the head of "Fresh beef in London from the United States," is a paragraph describing the conditions under which fresh beef, in quarters, has been safely transported across the Atlantic in the winter months. Subsequent advices reports that the newly discovered and patented process of preserving without any chemical appliances, and transporting unimpaired, fresh beef by simply suspending it in th atmosphere from which moisture is expelled and kept at a uniformly cool temperature, proves equally successful in the hottest weather. The Agricultural Gazette, speaking with reference to the London market, states: As we are now in receipt of an average weekly supply of some 400 tons of American beef, which, after being killed and packed about fourteen days in extreme hot weather, arrives quite sound, we may reasonably expect in the winter a very much largea supply. The herd and flock master of England will perceive that it is always possible that the impossible may happen. An unexpected revolution in their industry suddenly competitions, is in a moment dispersed, and the market thown open to the productions of the wibe, interminable pastures of the New World.

A correspondent of the Gazette indorses its frequent commendations of American beef, and states that in spite of the extreme temperature of the week ending August the 19, meat from the Western prt of the United States in the shambleat at Newgate was in as perfect condition as that taken up during the fourteen days since it was slaughtered. The development of this trade astonished the English people. The first trial cargo arived at Liverpool last Christmas, and its reception by the British meat consumers caused a rapid enlargement of the trade which has failed to meet the increasing demand on account of the necessary delay in fitting up the holds of vessels for its transportation. This American meat compares favorably with that of English production, much of which, according to the aforesaid correspondent, is of inferior quality. A great deal is artificially fed, producing an under proportion of fat and lean from the use of oleaginous foods. Such meat will not be able to compete with the American grass fed bullock.—*Agricultural Report for September.*

WASHINGTON TERRITORY CATTLE IN CHICAGO.—The Chicago *Brewers' Journal* says that large numbers of cattle are annually driven to the Union Pacific Railroad, some six hundred miles, and shipped to that point. It notes the arrival of some three thousand head "heavy, coarse cattle, but certainly showed well as to flesh, considering the hard usage they had to undergo in walking the long journey."

THE MOST PROFITABLE STOCK.—The Journal of the Royal Agricultural Society of England gives the results of inquiries put to seventy farmers as to the relative profits of raising horses, cattle and sheep. The preponderance of testimony is that raising horses, except for arm use, does not pay, and that farm horses can be raised cheaper than purchased. That when grass land is adapted to it cattle raising is advisable, feeding so as to turn them off for beef at two years old or a little more. That sheep are the easiest turned of any stock, more easily managed, and with far less labor.

HEIFERS SUCKLING THEIR CALVES.—The agricultural editor of the Connecticut *Courant*, having been criticised for recommending that heifers should always be allowed to suckle calves, gives the following reasons for this recommendation:

Our position in regard to suckling calves upon young heifers—their first one or two calves say—is that this natural action encourages the mothers in giving milk. The idea may seem novel to some, and then there is a difference in heifers. Some are more "foolish" and sentimental concerning their offspring than others. In breaking a heifer to milk I am apt to mix in with her calf a good deal, endeavoring to associate myself in the minds of both as a familiar object, so that my little stripping passes as a matter of course among the new and bewildering circumstances. Barring the opinions that may entertain among the selfish and short-sighted against the policy of developing the lacteal secretions in this natural manner—by allowing a heifer to "fuss around with a young calf"—the plan must look quite reasonable. It is certainly a time-honored practice among careful farmers, and a good deal of observation and some experience will warrant me in asserting that early indulgence in the cares of maternity is no detriment to the future productiveness of the grown-up cow. After three or four years of age, when the milking habit is formed, calves may be "deaconed" with less feeling on the part of the mother She is used to the hand of man, and becomes by habit reconciled to her lot.

THE opinion prevails with many persons that steers are more profitable than cows. The *Live Stock Journal* has a word with them and says: "If cheese is made, the ordinary cow will produce 1,600 pounds in four years, which at 12 cents per pound, will amount to $192. If butter is made, 600 pounds will be the product of four years, which, at 30 cents, will amount to $180; and 800 pounds of pork to $64 more—making the income from an ordinary cow for four years, in butter and pork, $240. Now, if we estimate that it costs $10 more in labor to milk the cow and work up the product than to take care of the steer, we must deduct from the product of the cow $40—reducing the butter product to $200. Now, the steer dressing 800 pounds will weigh 1,400 pounds on foot, and sell say at 6 cents, or $84; thus giving a cash product of less than half of the butter product of the cow."

THE Kentucky *Farmers' Home Journal* says: When the South takes to stock-raising, and the important relation which stock bears to a higher and more profitable agriculture than that thus far practiced, becomes properly understood and appreciated by the Southern farmer, then, indeed, the North will be nowhere by the side of the South.

For the removal of a savage bull, says a correspondent of the London Agricultural Gazette, have a girth around behind the shoulders, but in place of the rope being fastened to the ring, fasten it securely to one of the forelegs, just above the foot; then, when the bull attempts to run at the men that are leading him, the man behind pulls the rope, and down comes the bull on his knees. I have seen one of the savagest bulls tamed by bringing him a few times to his knees; and another advantage is, the pressure is not all on the ring.

Household Reading.

The Old Homestead.

When home the woodsman plods with ax
  Upon his shoulder swung,
And in the knotted apple tree
  Are scythe and sickle hung;
When low about her clay-built nest
  The mother swallow trills,
And decorously slow, the cows
  Are wending down the hills;
What a blessed picture of comfort
  In the evening shadows red
Is the good, old-fashioned homestead
With its bounteous table spread.

And when the winds moan wildly,
  When the woods are bare and brown,
And when the swallow's clay-built nest
  From the rafter crumbles down,
When all the untrod garden paths
  Are heaped with frozen leaves,
And icicles, like silver spikes
  Are set along the raves;
Then when the book from the shelf is brought
  And the fire lights shine and play—
In the good, old-fashioned homestead
  Is the farmer's holiday.

—[Alice Cary.

UP-COUNTRY LETTERS---NO. 9.

BY RACHEL A. ELY.

SITTING under a tree, with the cool breezes fanning my cheek and lifting my short hair playfully, my book drops into my lap and I gaze into the faraway landscape of broad valley and dim, distant mountain beyond, reaching miles away into melting space. Far back of my mountain home rises a hill that I longingly wondered when I came if I should ever climb its rugged sides. Now behold me its daily visitor, for I find renewed strength coming to me by *using*, and not *abusing*, what I gain. Sometimes I come alone, and often the children accompany me. But peace seems to reign supreme here, and my very breath is deepened and voice strengthened on its hight.

Finding a shady spot, I spread my "comfort" (a blessing to invalids, and made of two thicknesses of calico with wool between, tucked, and only wide and long enough to lie upon, very light to carry and easily made) and am at rest. How different from the "rest" the tired city folk usually take when they go to the mountains or the coast. I tried the coast one year, and never had a more tedious trip in my life, while others worked twice as hard as I to enjoy themselves, with no better success. One is either a slave to dress or feels shabby beside others, neither of which conditions is agreeable. My wonder is, how a woman can develop any great degree of intellect, fettered and bound as she is by fashion and dress. Even as school girls their thoughts and minds are dwarfed, in a measure, by the constant drain their dress has upon them.

My hostess feels sure the question of dress is one of vital importance in the future elevation of woman—explaining how the physical and mental strain is liable to produce moral weakness, and tends to make our girls weak and vain, as well as invalids to a certain extent. Oh, for the voice of an orator to speak to woman on this subject, of all others most thought about and least understood!

I see in your columns, Mr. Editor, an advertisement for the "combination underclothing" for women. They are, indeed, invaluable, and I can speak from experience. My hostess having got patterns, we are all wearing them, little children as well as the *father*, who says they are quite the thing for men to wear; and I would suggest to Government that soldiers adopt them, in place of the separate drawers and shirt they now wear, as the combination suit is more comfortable, cheaper, and more easily put on.

Turning my gaze in the direction of our sick woman's home and seeing the blue smoke rising from the chimney, reminds me that I have not mentioned her complete recovery. While the farm which they would give to make her well is still theirs, the overflowing gratitude of both husband and wife is bestowed upon my kind hostess for her great care and untiring attention for so many weeks. And when hope again began to light the calm face of the husband as he saw the gaining strength of the mother of his children and felt that her life was saved, his praise was loud and earnest, not to God alone, but to his little quiet little neighbor whose short hair, short dress and M. D. attached to her name he had so often before smiled at as *strong-minded* and *not womanly* enough for *him*. *Now* he is converted (as am I also) to the Divine help, *through* men or *women*, to do His will in any way they best can. Silently, quietly, and *without pay*, did this good woman go to work to save the suffering woman, and succeeded in spite of obstacles and the shrugging of the shoulders of the drug doctor who gave her up to die. And, verily, she hath her reward, but not in *money*. The husband is "put about," he says, to pay the drug bills and the doctor (who did not cure), and my hostess is glad to be charitable if they are willing to change their mode of life and learn how to keep well in future.

MORAL OF DANCING.

Prevents Suicide and Insanity.

BY A. G. S.

The Terpsichorean art is a reaction and an accomplishment of grace and gentility, cheap and easy to indulge, and needful in farmers', mechanics' and workingmen's homes to remove the cheerless monotony and prevent the nervous depression, discouragement, despondency, suicide and insanity sometimes resulting from dreary and drudging isolation. Such genteel and orderly exercise is altogether delightful, exhilerating and healthful. Nothing is more pleasant, inspiring and attractive in social gatherings, or tends more to unite and harmonize the hearts and hands of the people and to develop the finer elements of human nature. There is no sin in it; but its moral advantage requires proper management and supervision.

Avoid the excesses of cost, and late hours; abstain from liquors, and from chewing and smoking tobacco, and observe modest and quiet manners. Small companies and family circles are always preferable to large crowds and noisy and rushing hotel balls, which incline to be fast and boisterous. To

"Dance all night, till broad daylight,
  And go home with the girls in the morning,"

Is often quite coarse, wild and extravagant, and lacks the refining and civilizing influence of smaller groups of acquaintances and friends. But to call neighbors together at their own retired homes for three or four hours, at little or no expense, for the varied pleasant exercises of the dance, the waltz, the singing of good songs, conversations and declamations, perhaps, and the playing of inno-

cent and amusing games, is not only perfectly harmless but really charming and beautiful. The less the world has of gloomy, unhappy restraint, the better. Never turn a flower garden into a graveyard, but rather graveyards to flower gardens as far as possible.

To expend money for training mankind to be fearful, tearful, moaning and groaning, is pitiful and cruel. The object of life is happiness. Therefore, don't be miserable; but jump right straight out of that most foolish feeling at once. What's the use? Be glad you live! Catch the bright warm sunshine of joyous glee. Make the red blood dance in the veins, and the heart and feet to bound with love, affection and generous impulse. Call together the young and the old; stir up the stiff, frigid and stupid community; melt away all personal animosity and bitterness; tear down prejudice and unsocial division, and regard every workingman and woman as brother and sister—casting aside unmeaning names and distinctions. There is no virtue in them

Dance! Dance in the family, the grange, the sovereign lodge, the picnic! Dance on the holidays! Shake the people into closer unity! Organize in brotherly clubs, unions, granges and lodges for social strength and good cheer! Revolutionize! jubilate! hurrah! "Shake them up! shake them down! forward and back! cross over! down the middle! round outside! all hands round! swing six! balance all!" Dance the cotillon, the quadrille, the schottische, the Spanish. That's it. Now retire; it is twelve o'clock. Get a good rest and sleep; and what's the result? Don't every one feel better? Of course they do; there is no mistake about it. This makes the right sort of Shakers—that is, the *marrying* kind. Just think of it—the workers all becoming Grangers, Sovereigns and "Shakers!" They will capture the whole proud continent, sure. Such a method of life is a

GRAND PROTECTION

Against the blues, sulks, horrors, scandals and consequent neighborhood quarrels, suicides and the insane asylum. It is the power of social sympathy, needed by all. Therefore, let working people everywhere demand more time for thought, less for hard work, better wages, and more recreation and amusement. This is the kind of voice of all true religion, and of workingmen's politics. Call it the moral of dancing. Be happy, O good people, and leave off the whisky and lager beer. Do these drinks belong to temperance, or to true refinement and civilization?

Champlin, Minnesota.

SATURDAY EVENING REVERY---NO. 2.

BY M. E. T.

I think I am beginning to love these evening reveries. There seems to creep into them a kind of happy expectation, as though some bright idea would suddenly present itself and in some mysterious manner point out a means of deliverance from our present sad condition.

Our manner of living has become so complicated, so formal and exacting, that in order to reach the social standpoint our domestic comfort is made to suffer. I believe that it is Clarence Cook who says that "America is the only land known to geographers where the greater part of the population lives to please its neighbors." This is truly said of this particular class of people. Everything we do is made subservient to this important end; and so arduous has this labor become that we no longer find time for pleasant or profitable reading. We stint and deny ourselves in the way of books and magazines, while the dimes that would get them go for a new set of china, a new bonnet or some fine lace trimming, "just like Mrs. B's." We say to our accusing conscience, "O well, I never have time to read nowadays;" but we find time to ruffle and tuck and puff, to the space of two weeks' work on one dress, because our friends in the set to which we belong expect it, and we must do as they do. We forget that they are able to indulge in these extravagances without discomfort to themselves or injury to any one. Just here a great error arises from our agonizing efforts to cope with the mighty odds that money brings; but I must beg my readers to wait for another *revery* in which to immortalize my subject, since I suddenly remember a visit to San Jose to be made on Tuesday next, and in the meantime I must finish a new suit, which, in order to be perfect, must have a ruffle and puff on the lower skirt, a puff and ruffle on the overskirts. There are many bias bands, and six dozen buttons to set on; all this, and only one day in which to get ready. After my visit, and in my next revery, I shall attempt to gather up the tangled thread and proceed with the trials of us "Poor but respectable people."

FURTHER FROM "GRANDPA" ON THE "SUPREMACY" QUESTION.

Grandpa is glad to have drawn this expression from "Girls' Rights" pen: "Yes, that is right." The legitimate boundary to which it alludes is *love*, pure, holy love. There is also a legal boundary which Grandpa is not so able to define, but he would point "Girls' Rights" to a case now on hand, where the masculine is at present, and has been near, if not quite, two years confined in the San Jose jail, all through that masculine supremacy not having been exercised as it should have been. (The case is that of Mr. A——ys.) Who does the law regard as the supreme head, the responsible party? Who does it take hold of and incarcerate in prison if not submissive to its dictates, as in the case mentioned? True enough, husbands are liable to err, by which fortunes are lost, wives brought to poverty, etc. But, dear "Girls' Rights," would the world be saved from these disasters by reversing this "supremacy" question? No danger, where love is kept, as it should and ought to be; but *mutual rights* and concessions will have also. As a usual thing, it is "the husband's home and business the wife comes to, and he only is competent to judge, &c., viz: whether as farmer he shall live on his farm or in the city; as blacksmith, near his shop or in a fine house in the suburbs. If these are extreme cases, they have their parallelisms on a small scale. Grandpa, in the course of a long life, cannot call half a dozen cases to mind where it was been the other way, i. e., where the wife has taken the husband *to her* home and business, &c. One case of this kind is on his mind, and worthy of mention because of its happy results. Dear "Girls' Rights," go do likewise. This was a case of a lady conducting a prosperous private seminary, owning the house and home where she lived. She married the gospel minister of the place, and he came to *her* home and surroundings, she retaining precisely the su remacy she had always held: and a very happy union it was till death severed the tie. This, so unusual a case, is neither a rule nor a criterion. Thanks to "Girls' Rights" for another sentence: "Why, then you need not ask any more." Just so; and that is what the darling Angie comes to if we can only keep up the love principle where it *ought* to be and has a *right* to be—on both the masculine and feminine side. Then, with judicious care and discretion, the financial affairs will be known; the comfortable house and buggy come in due season, and all jars and discords be now and forever avoided.

P. S.—The feminine supremacy was also acknowledged. Will not "Girls' Rights" give us something on that part of the subject? GRANDPA.

Domestic.

The Maiden's Choice.

Oh give me the life of a farmer's wife,
In the fields and woods so bright,
'Mong the singing birds and the lowing herds,
And the clover blossoms white;
The note of the morning's heavenward lark
Is the music sweet for me,
And the dewy flowers in the early hours
The gems I love to see.

Oh! give me the breeze from the waving trees,
The murmur of summer leaves,
And the swallow's song as he skips along,
Or twitters beneath the eaves;
The plowman's shout as he's turning out
His team at setting sun,
Or his merry good-night by the fire-fly's light
When his daily work is done.

And give me the root and the luscious fruit
My own hands rear for food,
And the bread so light and honey-white,
And the milk so pure and good;
For sweet the bread of labor is,
When the heart is strong and true,
And a blessing will come to the hearth and home,
If our best we bravely do.

FAMILIAR TALKS---No. 13.

BY SNIP.

NOW that the heated, busy term of the year is past, I hope the Domestic Department of the Agriculturist will be better patronized by correspondents than it has for some time back. Has "Ansie" despaired of hearing from us? I hope she has not kept those *doughnuts* waiting till now, not knowing what to do with them. Well, my dear "Ansie," I must plead ignorance of the "black art" that would enable me to cook without flour. Gladly would I impart to others the knowledge did I but possess such a secret. Not only would it lessen house hold expenses, but were there only one-half the amount of flour consumed that now is, there might be *more diversity in farming*. There would be fewer men who would put in a great quantity of wheat, and then hang around the saloons, living on the interest of the money they "expect to get" for their crop. But to return to those unfortunate doughnuts. I seldom measure flour for doughnuts, and never for cookies—using for both just enough to make them roll out.

As the season for mince pies and fruit-cake is drawing near, perhaps a receipt or two will not be amiss. This receipt

FOR MINCE-PIES

Is good, though if any ingredient is objectionable it can be omitted: 1 pound of roasted or boiled beef; ½ peck of apples; 1 pound raisins; ¼ pound currants; 1 nutmeg; 1 tablespoonful of ground cloves; 2 of cinnamon; 1 pound sugar; the grated rind and the juice of 2 lemons. Moisten with cider and let it stand over night, or longer if you wish. When su d, put in two ounces of citron, y thin strips. Th s for half a pound this necessitates having the pies hot when eaten, and all do not like them so.

WHITE MOUNTAIN CAKE.

Four eggs, well beaten with 2½ cups of white sugar; 1 large cup of butter; 1 cup of sour milk; 1 teaspoonful of soda; 5 cups of flour; 1 teaspoonful of vanilla; 1 of lemon; 1 heaping cup of raisins (whole without stoning); ½ cup of candied orange peel and citron sliced; ¼ cup of almond ments sliced. This amount will make two common-sized cakes.

ORANGE CAKE.

Two cups of sugar; 2 cups flour; 1 small cup of butter; ¾ cup of water; yolks of 5 eggs; whites of 3 eggs; 1 teaspoonful of cream-tartar; ½ teaspoonful of soda; the juice and grated rind of one orange (or of a lemon). Beat the yolks and sugar together, and add the whites beaten to a stiff froth; then the other ingredients. Bake in jelly-pans. Add the juice and grated rind of an orange to the whites of two eggs; add white sugar to make sufficiently stiff to put between the cakes when they are cold.

WASHING FLANNELS.

BY ANSIE.

I have had some experience in washing flannels, and observed one or two important facts that most people seem to overlook. I think it better to wash them in cool water, as they will shrink just the same from being hung out in the cold air after washing in hot water, as they will from being put from cold to hot water, or from hot to cold water. The object is to secure a *uniform temperature* from the time they are wet until dry, and also each time they are washed. Washing in cold water one week and the next week in hot water also causes shrinkage. White flannels and merinos look better if a little ammonia is added to the wash-water. I have never tried borax water, excepting for black silks. It is good for silks. Silks also are very much improved if ammonia is added to the water they are washed in. Both silks and flannels should be washed in water that has not been used for washing other clothing.

[Following we append several recipes upon this subject, selected from various sources.—Ed.]

Washing Woolens.—The secret of washing woolen goods successfully lies in avoiding rubbing, which shrinks or fulls the fabric. Many washers advocate scalding water for white flannels; others are equally enthusiastic over the advantages of cold water, but all agree that rubbing is detrimental. The rinsing water should be of the same temperature as the suds, whether that be hot or cold, and the wringing should leave as little water as possible in the goods. Colored flannel should not be scalded, but washed in suds as hot as the hands can bear and rinsed in clear water. The garments should be wrung as dry as possible with the hands, then wrung again in a dry towel and dried quickly by the fire to preserve the color. Small articles may often be ironed without previous drying.

Washing Fine Underclothing.—A leading firm, importers and retailers of hosiery goods in Philadelphia, gives the *Germantown Telegraph* the following directions for washing merino lamb's wool and silk underclothing, and that paper bears witness to its excellence: "Use one pound of dissolved soap in four gallons of warm water, in which well rinse the articles to be washed, drawing them repeatedly through the hand; wring them as dry as possible to remove the soap;

rinse them again briskly in clean luke-warm water: wring and stretch to their proper shape, and dry in the open air if possible. The only effect of rubbing is to shrink and destroy the material; it should therefore never be resorted to. The material used in manufacturing silk underwear being no animal product, it is absolutely necessary that nothing but the best quality of soap and warm water should be used. All kinds of washing compound destroy the nature of the material, giving to the fabric the appearance of poor cotton."

Cleansing Blankets—It is quite as important to have the blankets on our beds clean as well as to have the sheets pure and white. "Put two large tablespoonfuls of borax and a pint bowl of soap suds into a tub of cold water. When dissolved, put in a pair of blankets and let them remain over night. Next day rub and drain them out, and rinse thoroughly in two waters, and hang them out to dry. Do not wring them."

Durable Bedding.—A woman who has raised a large family recommends housekeepers to the good quality of unbleached cotton, run the breadths for top and lining of quilt, and color it with any cheap domestic dye—such as japonica annatto, white oak or any such thing. Quilt them coarsely, and put more cotton batting in than would be needed for ordinary bed quilts. They will wear years longer than ordinary new calico, and are especially to be desired in large families of boys. If desired, outside spreads may be made of more fanciful material.

Beneficial Effect of Flannel—The majority of people are not aware of the beneficial effect of wearing flannel next to the body, both in cold and warm weather. Flannel is not so uncomfortable in warm weather as prejudiced people believe. Frequently colds and constant hacking coughs have left me since adopting flannel garments. There is no need of great bulk about the waist which condemns the wearing of flannel to those who prefer waspwaists to health, for in that case flannel can be cut as loosely fitting waists, always fastening at the back. There are scarcely any of the bad effects of sudden changes of weather felt by those who wear flannel, and mothers, especially, should endeavor to secure such for their little people in preference to all those showy outside trimmings which fashion commands. —*Ex.*

MOUNTING CHROMOS.

Large chromos should be mounted on a stretcher. A stretcher is made of strips one and one-half inch wide, ripped from common inch or ¾-inch lumber, mitered and made into a frame. Stretch upon this, pasting or tacking smoothly, tightly, over the whole face of the stretcher frame a piece of light domestic. Common flour paste, made smooth, is suitable to use for mounting the chromo upon the stretcher. Of course the stretcher must not be any larger than the picture. Paste both the back of the picture and the cloth, and lay on and rub with a damp cloth till it is smoothly adhered to the stretcher. The drying will shrink the cloth so that no wrinkles will appear. Before varnishing, the first and most essential operation is the proper sizing of the paper, as, if this be imperfectly done, almost any kind of varnish will penetrate the paper so as to make oil-spots. Glue-water of the proper consistency is the best protective against the absorption of the varnish. It should be of the right strength, however. If, after being dried, it cracks in bending a corner of the paper, it was not diluted enough. When dry, the map or chromo is varnished with a solution of mastic, sandarac, or some other colorless resin in turpentine or alcohol, or a mixture of both; experience shows the best consistency in order to lay it on evenly with a brush.

A good varnish can be purchased at paint stores. Use none but the best quality for chromos. Small chromos may be mounted on pasteboard and varnished the same. Chromos may also be framed under glass, without mounting or varnish, the same as engravings, if one prefers it.

HOME-MADE PICTURE FRAMES.

Frames for pictures can be made of a great many materials. If tastely made, it matters little what is used. Acorns, with leaves made of leather, in imitation, make beautiful frames when neatly arranged and varnished. We have seen pretty frames made of rice fastened thickly to plain, beveled boards with glue and varnish; also of beans, pebbles, shells, etc. Rustic frames can be made of bits of wood tacked on a rough board frame and varnished. Choose gnarled roots and limbs, remove the bark, split in halves, all arranged flat side to the board in any shape that taste may suggest. Stain or not as you choose, and varnish. Do not mix too many things together. A frame of shells should be all shells; of rice, all rice, etc. A rustic frame may be made of knotty material and be made to resemble coral work.

To make artificial coral, take two drachms of vermillion, one ounce of rosin, and melt them together. Have ready the branches of twigs, peeled and dried, fasten in any shape desired with pins or small nails, and paint them over with this mixture while hot. The twigs being covered, hold them over a gentle fire, turning them around until they are perfectly smooth. White coral may be made with white lead, and black with lampblack. Another way is as follows: Pound a quantity of good red sealing wax and mix with spirits of wine into a thick paste. Into this put some large, unbroken Carolina rice, stir well, and if it is of proper consistency every grain will be entirely covered with the paste. With this you can paint frames, card-baskets, brackets made of pasteboard, etc. Varnish, and you will be pleased with the effect.

Here is how to make pretty corn-husk frames: "Corn-husk frames may be made very prettily and simply by taking pasteboard or thick paper to sew the husks on. Then select your husks; take fine, white ones, but not the finest. Take a husk and cut it into strips three-quarters of an inch wide and three inches long. Then double it together in a bow as in tape trimming. Put two rows of these bows around the inside of the frame. Next cut a piece the length of the bows and the width of the husks, and bend the two ends together. Now take your needle, and stit it very fine through the center, and then sew the two ends that you hold in your hand on the frame overlapping the row of bows, one row of this slitted work, and turn and go lengthwise of the frame not crosswise as before. That forms the outer edge of the frame. Take a thin piece of board and make a frame. Place your glass between your paper frame and your board frame, and tack or paste your paper frame down smoothly. You will then have a nice rustic frame. Beautiful little card-baskets and lamp-mats may be made in nearly the same manner."

Rustic frames, skillfully designed, made of all the different varieties of burrs; of all varieties of mosses; of nut-shells, every kind; of stones, all the prettiest pebbles that can be found, look much better than to have a mixture of everything that can be available for fancy-work frames.

Persons wanting walnut or gilt frames will please notice our offer in an editorial note.

SEASONABLE SELECTIONS.

How to Carve and Help at Table.—It is considered an accomplishment for a lady to know how to carve well at her own table. The carving knife should be sharp and thin.

To carve fowls (which should always be laid with the breast uppermost), place the fork in the breast, and take off the wings and legs without turning the fowl; then cut out the merry thought, slice from the breast, take out the collar bone, cut off the side pieces, and then cut the carcass in two. Divide the joints in the leg of a turkey.

In carving a sirloin, cut thin slices from the side next to you (it must be put on the dish with the tenderloin underneath) then turn it, and cut from the tenderloin. Help the guests to both kinds.

In carving a leg of mutton or ham, begin by cutting across the middle to the bone. Cut a tongue across and not lengthwise, and help from the middle part.

Carve a fore-quarter of lamb by separating the shoulder from the ribs, and then divide the ribs.

To carve a loin of veal, begin at the smaller end and separate the ribs. Help each one to a piece of kidney and its fat. Carve pork and mutton in the same way.

To carve a fillet of veal, begin at the top and help to the dressing with each slice. In a breast of veal, separate the breast and brisket and then cut them up, asking which part is prefered.

In carving a pig, it is customary to divide it and take off the head before it comes to the table, as, to many persons the head is revolting. Cut off the limbs and divide the ribs.

In carving venison, make a deep incision down to the bone to let out the juices, and turn the broad end toward you, cutting deep in thin slices.

For a saddle of venison, cut from the tail toward the other end, on each side, in thin slices. Warm plates are very necessary with venison and mutton, and in winter are desirable for all meats. —*Ex.*

Pumpkin Butter (Original).—Cut up as much pumpkin or squash as desired, and cook without paring until tender. Strain or press the juice out; then pare other pumpkin and cook fine in the same juice. When thoroughly stewed down to about the consistency of apple, put away in jars the same as other preserves, to be used as other sauce, or may be used in pies without sweetening.

Here is another way: A writer who has tried it, says to preserve pumpkin, take seven pounds of pumpkin, five pounds of sugar, four lemons, and two ounces of green ginger root. Cut the pumpkin in slices half an inch thick in any desired form, square, round or diamond shape, and boil in the syrup till tender, then take up the pieces. Slice the lemon and ginger root very thin and scald them in a little clear water, after which add them to the syrup; boil the latter down until it is clear enough to keep without fermenting, and then add the pumpkin to it.

Stewed Fowl.—Fill the inside of a young fowl with oysters, put it into a jar or tin pail tightly closed, and put into a kettle of water. Boil an hour and a half. There will be a quantity of gravy from the fowl and oysters. Add to it a little flour made smooth in a small quantity of water, some butter, seasoning to taste, and more oysters with their liquor. Serve this with the fowl, which will be very white and tender. All the fine flavor in ordinary boiling will be preserved.

Meat Loaf.—Chop fine whatever cold meat you may have, fat and lean together, add pepper, salt and finely-chopped onion, two slices of bread which has been soaked in milk, and one egg; mix well together and bake in form. This makes an admirable tea or breakfast dish.

Pop-Overs.—Four eggs, four cups of fine graham flour, four cups of milk, or simply good milk and the best of white flour made into a rather soft batter. These may be baked in gem tins or gem irons, or small cups which should be previously heated. Bake in a hot oven and eat with fruit sauce.

Stuffino for Turkeys and Chickens. A handful of soaked bread squeezed dry, two eggs, a little finely chopped parsely, dessert-spoonful of ground ginger, a pinch of salt, a small bit of butter or beef dripping. Chickens or turkeys seasoned with ground ginger and salt, have a very delicate and rich flavor.

Sausage.—For 30 lbs. of meat, well cut, add 12 oz. fine salt, 6 oz. pulverized sage' 1 oz. black pepper, two tablespoons of mustard, summer savory to the taste.

Beet Vinegar.—Grate the beet, says the *Farmers' Advocate*, and express the juice in a cheese press, or in any other way that may suggest itself, and put the liquor in any empty barrel; cover the bung-hole with gauze; and set it in the sun, and in twelve or fifteen days it will be ready for use.

Bi-Sulphide of Carbon--Philloxera

From a paper read by Dr. Blake before the Acadamy of Science, we condense the following advice: Owing to the extreme volatility of this substance, its vapor, when it is introduced at some distance beneath the surface, would permeate the earth in all directions over a considerable area, and thus would have a chance of reaching even the distant rootlets of the vine. Although it had been reported in France that the substance was not destructive to the insect, yet I believed that the soft, apparently nude form, which I had just discovered, would not resist it. In order to introduce the substance beneath the ground, an iron tube was taken with a sharp steel point at one end, the side being pierced with a few small holes near the bottom, and a piston was made which could be forced down the tube. The tube was driven into the earth for a distance of two or three feet, near the root of the vine; some bisulphide of carbon was poured into the tube which was then filled with water, and the contents of the tube forced into the ground with the piston. The tube was drawn out and the hole filled up. The quantity used on each vine was about an ounce and a half of the bisulphide. This was introduced

nto the ground through two or three oles. The substance was applied in he end of April and early part of May, nly one application being made, and in very instance to plants that were evi- lently suffering from the disease. The esult has been, on the vines so treated he insect has almost entirely disappear- d, whilst on the vines that were in the ame condition last year as those to vhich the bisulphide had been applied, ont which were not treated, the roots warm with the insect, so that none of hem are likely to survive this season, t least of those that were most affected. The bisulphide of carbon can be ob- ained now in a comparatively pure state t about 50 cents per pound; and I am confident it can be produced in a form uite suitable for use in the vineyard at third of the price, so that the cost of he material for each vine would not ex- eed two or three cents. The refuse ime from the gas works will kill the in- sect for some distance beneath the sur- face when it has been applied round the roots, and from what we know of the natural history of the insect it is almost certain that it will shortly die out in any great depth, when it cannot be renewed by fresh nymphs developed from the win- er ova. During the winter, and as late as possible before the cessation of the rains apply three or four pounds of the lime refuse round the stem, drawing the earth away from the stem to the depth of two or three inches, at the same time brush- ing the stem for six or eight inches above the ground with train oil. Then about the middle of April to the first week in May use the bisulphide of car- bon under ground in the way I have pointed out.

RELIABLE SEEDS.

ONION AND CARROT SEED AT WHOLESALE PRICES.

Every person who has ever planted vegetables has had more or less trouble about procuring fresh pure seed true to name. Many of the seeds sold at stores throughout the country are grown with- out special care or selection of stock. Instead of the best vegetables being se- lected for seeds, frequently none but he refuse are thus used, and as a conse- quence inferior vegetables only can be grown from them. Seed growing is a profession that requires special care and skill. Pure seed, that is, seed that will bring varieties true to name, can only be grown from perfect roots, and away from other varieties, so there will be no mixture.

Mr. Wm. Clemence of San Jose, who we know to be thoroughly reliable, and who has for several years paid consider- able attention to seed growing, has pro- duced this season a quantity of pure Yellow Danvers onion seed, and of White Belgian carrot seeds. The on- ions were grown from pure seed, and none but the finest onions saved for planting for seed. They were all se- lected with care, and the seeds of this year's growing were produced far away from any other varieties, so there is no possible mixture. The same with the carrots—they are true to name.

We have made arrangements with Mr. Clemence for his entire crop of these seeds, to furnish to our subscribers. We will furnish, in packages of one pound or over, at the following rates:

Yellow Danvers Onion Seed—Per lb., postage paid, $1.50. Persons taking from our office, or by express at their own ex- pense, will be allowed postage rates—6 cts. per lb.—off.

White Belgian Carrot Seed—Per lb., postage paid, $1; or 16 cts. less if we pay no postage.

The yellow Danvers onion is the most compact, firm of flesh, and the longest keeping of any onion. There are many grown near San Jose every year for the San Francisco market. They often yield over one thousand bushels per acre when properly cultivated. The Eastern catalogue prices for seed per pound is from $3.75 to $4.00 and the California raised seed is the best in the world. Our subscribers will at once see the bargain and advantage we are offering them.

The white Belgian carrot is the largest and best producer known. The best stock carrot and the easiest harvested, the crop may be gathered by hand as nearly half the vegetable grows out of the ground.

The Eastern price for pure carrot seed is $2 per pound, double what we offer it for to our readers. All the seed we offer is fresh, grown this season (no old seed mixed with it), and will be put up in packages by Mr. Clemence to our order.

Our object in giving our readers the advantage of wholesale rates, is to oblige you and gain patronage for the Cal. Agriculturist. *Thorough surface*—not deep—*cultivation*, is the best for onions, and the sooner they are sown now the better. Carrots need a soilstirred a little deeper, but quite as thoroughly, and may be planted from now to first of February. Send in orders for seeds at once, as our supply is limited.

To Farmers.—The California Agriculturist is *your paper*, devoted *exclusively* to your interests; in its success is your prosperity. Assist us, then, by giving us for publication your experience in the different branches of farming, and by so doing make the California Agriculturist a public channel of communication for all the farmers throughout this and other Pacific States; and at the same time don't forget to make your neighbor suscribe; it is his interest to take a good agricultural paper, and it is to your interest, as a patron and friend of the paper, to have him do so.

Our Boys and Girls will probably feel a little disappointed this month, but we trust they will have patience when they learn that Aunt Polly has had sickness in the family. She sends her compli- ments, and promises a full department next month.

A Heroic Boy.—Freddie Tenny, of Alleghany, only ten years old, is a mate to the boy who stood on the burning deck, if somebody would only sing him into fame. His father and mother be- ing away for all night, Freddie was left to keep house and take care of his younger brother—a five-year old. Dur- ing the night Freddie was awakened by smoke and nearly suffocated. He saw that the house was on fire, the floor hav- ing caught from coals that had fallen from the stove in the dining-room. He gathered up his little brother and set him out in the cold, and then proceeded to carry water in a pail and put out the fire. He extinguished the flames, took his little brother back to bed, and both slept well till morning. In the morning Freddie called in a family who lived in another part of the house to see what happened. Two holes were burned through the floor—one two feet in diam- eter and the other one foot. The little fireman had saved the property, and probably some lives, and had all the fun to himself. He was charged to take care of his little brother and keep house, and he did it like a man.

PROCLAMATION.

Chicago & Northwestern Railway.

Is the popular route overland to the East.

Passengers for Chicago, Niagara Falls, Pittsburg, Philadelphia, Montreal, Quebec, New York Boston, or any point East, should buy their trans-continental tickets via the pioneer route,

THE CHICAGO & NORTHWESTERN R.R.

This is the Best route East. Its Track is of Steel Rails, and on it has been made the Fastest time that has ever been made in this country. By this route passengers for points east of Chicago have choice of the following lines from Chicago:

Pittsburg, Fortwayne and Chicago and Pennsylvania Railways.

3 Through trains daily, with Pullman Palace
3 Cars through to Philadelphia and New York on each train.

THROUGH TRAIN WITH PULLMAN PALace Cars to Baltimore and Washington.

By the Lake Shore and Michigan Southern Railway and Connections (Fire York Central and Erie Railways):

3 THROUGH TRAINS DAILY, WITH PALACE
3 Drawing Room and Silver Palace Sleeping Cars through to New York.

By the Michigan Central, Great Trunk, Great Western and Erie and New York Central Railways:

3 Through trains, with Pullman Palace Draw-
3 ing Room and Sleeping Cars through to New York to Niagara Falls, Buffalo, Rochester, or New York city.

By the Baltimore and Ohio Railroad:

2 Through trains daily, with Pullman Palace
2 Cars for Newark, Zanesville, Wheeling, Washington and Baltimore without change.

This is the Shortest, Best, and only line running Pullman celebrated Palace sleeping cars and coaches, connecting with Union Pacific Railroad at Omaha and from the West, via Chicago Junction, Marshall, Cedar Rapids, Clinton, Sterling and Dixon, for Chicago and the East.

This popular route is unsurpassed for Speed, Comfort and Safety. The smooth, well-ballasted and perfect track of steel rails, the celebrated Pullman Palace Sleeping Cars, the perfect Telegraph System of moving trains, the regularity with which they run, the admirable arrangement for running through trains to Chicago from all points West, secure to passengers all the comforts in modern Railway Traveling. No changes of Cars and no tedious delays at Ferries.

Passengers will find Tickets via this Favorite Route at the General Ticket Office of the Central Pacific Railroad, Sacramento, and in all the Ticket Offices of the Central Pacific Railroad.

MARVIN HUGHITT, Gen. Supt., Chicago. W. H. STENNETT, Gen. Pass. Agent.

—AND—

GENERAL AUCTIONEERS,

312 Market St., San Jose,

HAVE FOR SALE, IN SANTA CLARA AND adjoining Counties, a very fine list of Grain and Stock Farms, improved and unimproved, in in tracts from 10 acres to 10,000, which they offer upon easy terms and at low prices; also, a large list of Business and Residence property in Santa Clara and San Jose. We append a partial list. Having resided in this county for 26 years, and being thoroughly posted as regards Real Estate Values, we respectfully solicit all in search of Homes, Stock, or business of any kind to give us a call.

10 Acres near the town of Santa Clara, with fine House and Out-buildings, good Orchard, Ornamental Trees, etc. Price, $10,000.

20 Acres of Unimproved Land in the Willows, being part of the Lupton Estate. Price $3,000.

30 Acres, under fence, all in cultivation; has a House of 4 rooms, Barn and Stable-room for 15 horses, good Well, splendid water. Also, 23 acres adjoining with Redwood House, Barn, etc., good Well; all under cultivation. Price, $55 per acre.

21 Acres of fine land, 3 miles from San Jose, east of Coyote, well enclosed, good Adobe House, Large Barn, etc. Price, $4,000.

38 Acres of fine land, 2 miles south of San Jose, lying between the Monterey Road and the Coyote Creek. The soil is unsurpassed, and the location beautiful. Will be sold as a whole, or in three subdivisions: 22 acres fronting on Coyote, at $225 per acre; 8 acres between the two residence lots, at $300 per acre; 16 acres including the fine improvements for $5,000.

60 Acres of as fine land as can be found in the county, with fine improvement. Will sell low if called for within next 90 days; must be sold in that time. Situate one mile from Lawrence Station, S. P. R. R.

18 Acres fine Vegetable Land, 3 miles southeast of San Jose, on east side of Tully Road; has a Dwelling of 6 rooms (two-story house); Barn, etc.; Orchard and Vineyard of 5 acres; Cows, Wagons, Farming Implements, etc. Price of whole, $4,500.

1,000 Acres of fine Grain and Fruit Land, located near Los Gatos; will be sold in tracts to suitat from 40 to 1000 acres. Terms easy; prices low; must be sold within 90 days.

76 Acres rolling land 8 miles west of San Jose, adjoining Reynolds' farm. Small house of 5 rooms; nice running stream of water; well fenced; with plenty of wood on the premises. Price, $2,800.

108 Acres land on San Jose and Santa Cruz road, near Los Gatos, 5 miles from San Jose; excellent land, and well prepared for thing: improvements consist of a dwelling which cost $2,000, a good barn, also orchard and vineyard, good well, wind mill and large tank. Terms, ⅓ cash; balance on time. Price, $95 per acre.

88 Acres fine land 6 miles west of San Jose, near Lawrence Station; well improved. Price, $100 per acre, on reasonable terms.

290 Acres 5 miles west of Gilroy; 30 acres vineyard; 30 acres orchard, all kinds of fruits; 3 living streams of water; all under fence; has a good house, barn and other out-buildings; wine cellars. Terms easy. Price, $10,000.

Stock farm of 2,000 acres, enclosed with brush fence and natural boundaries, located about 10 miles east of the 18-mile house, near Bennett's stock farm; well improved; has a good dwelling, barn, corrals, etc.; 80 head of American cattle, 46 of which are cows, balance one and two year olds. Terms easy. Price, $3,000.

42 31 100 Acres land on the road Guadalupe Mines, near the Los Gatos road, adjoining lands of F. Richmond. Terms easy. Price, $3,000.

242 Acres fine land, near San Jose; will be sold on a long credit. $5,000 cash; balance in 6 years, equal annual payments, with interest at 10 per cent per annum.

200 Acres of excellent fruit and berry land near Santa Clara depot. Price per acre, $200.

200 Acres in Alameda county, on west side of county road leading to Oakland, about one mile from Warm Springs, near Mission San Jose. It is fine black loam soil, well fenced. Has a good house and barn, etc. Price, $80 per acre; one-fourth cash; balance in one, two and three years, approved paper bearing one per cent. interest.

500 Acres of extra fine grain land 5 miles southwest of Watsonville and 1½ miles from shipping point, will yield 40 to 60 bushels per acre. Terms to suit purchasers. Price, $50 per acre.

160 Acres of pre-emption claim 35 miles southwest of Salinas City, 10 miles west of railroad terminus. Small house, good fence, out-houses, etc.; with an outside range of 800 acres, all finely watered. This is one of the finest hay ranches to be found in the country. Price, $1000; or will exchange for San Jose property.

160 Acres of fine timbered land located just on the line between Santa Clara and Santa Cruz counties. No place of property on Santa Cruz mountains to excel it. Price, $6,000.

120 Acres fine land adjoining village of Saratoga; enclosed; title perfect. Price per acre, $50. Also, a farm of 160 acres 1½ miles south of Saratoga; good dwelling, barn, orchard and vineyard. Price, $4000.

81-Acre farm 4 miles northeast of San Jose; is a choice piece of land, with house 18x24 feet, small barn, etc. Price, $7,000.

SAN JOSE INSTITUTE

—AND—

BUSINESS COLLEGE.

A Day and Boarding School for Both Sexes.

THE SECOND SESSION OF THE TWENTY-3d, 1876.

Fourth School Year will commence October

In acknowledging the kindness of the patrons of this School, the Proprietors desire to assure them that with the increased patronage will be added increased facilities for imparting instruction. They intend that the School shall offer the very best opportunities for acquiring thorough education, both theoretical and practical.

The course of study in the Academic grade is extensive and thorough.

The Business College has no vacations.

Students from a distance will find pleasant rooms and board at reasonable prices at the boarding-house.

The Faculty accept to its fullest extent the growing demand of the industrial classes for recognition in the public educational system hailing it as the harbinger of a higher and better civilization.

ISAAC KINLEY,
Superintendent of the Institute.

C. S. Crydenwise,

CARRIAGE MAKER. PIONEER Carriage Shop.

Save $50! Why Pay $85?

Sewing Machines

REDUCED PRICE, $35.

Home & Home Shuttle Sewing Machines

Reduced to Live and Let Live Prices.

THESE MACHINES ARE ALL SUPERIOR to any and all; nice sewers, straight needle, two threads, shuttle, lock-stitch, the simplest and cheapest, and the lightest running first-class machines in the market. To see is to convince yourselves. ☞ Remember, all Home and Home Shuttle Sewing Machines have the Hall Treadle attached without extra charge.

THE HALL TREADLE

For Sewing Machines,

THE MOST IMPORTANT IMPROVEMENT EVER MADE.

It saves labor and preserved health. No more diseases and deaths, side or back aches from using sewing machines. No teaching required. A child can run it. Always starts the right way. Never goes backwards and breaks things. Can be stopped instantly. With it on your machine, you can do double the work you can do without it. Fifty stitches can be made with one pressure of one foot. Approved by the Massachusetts State Board of Health (see official report, 1872), Massachusetts Medical Society, and Massachusetts Charitable Mechanics' Association. The HALL TREADLE is a part of all HOME MACHINES sold by me.

☞ The Hall Treadle can be attached to any other sewing machine. Remember this. We will attach it onto any machine. It will cost you only $12, and will save you a deal of hard work and trouble.

THE HALL TREADLE GRINDING MACHINE

Must be seen to be appreciated. For a Farmer or Mechanic to see it, is to buy one. It is an indispensable article in every house, shop or hotel.

THE HALL TREADLE JIG SAW AND BORING MACHINE

Is an accomplishment in every workshop. The Hall Treadle is applicable to all machinery requiring a food power—Sewing Machines, Grindstones, Jig Saws, Turning Lathes, Jewelers' and Dentists' Lathes, etc. Send for circulars.

OUR MACHINIST.

In connection with my regular business, I have a fine MACHINE SHOP, for repairing all kinds of machines and like work, and have employed MR. CHARLES C. REDMOND, a Skillful Mechanic, as manager, and am now prepared to repair machines and machinery, make models, etc., on the most reasonable terms, and ALL WORK GUARANTEED.

B. J. SALISBURY,

323 Santa Clara Street, San Jose.

"THOSE RULES."

GILROY, Oct. 25th, 1876.

CAL. FINE ART PUB. CO.—Gents: Inclosed please find stamps for four dozen more of those rules. Send at your earliest convenience. The children are impatient. The dozen I first obtained are all sold, and the scholars are much pleased.

Respectfully yours,

ANNIE THOMASSON, Teacher.

Something New, Ladies!

Just What You Want for Yourself and Children.

DON'T FAIL to SEND FOR a PATTERN

Comfortable Combination Clothing.

THESE SUITS ARE CALCULATED FOR Healthfulness, Comfort and Convenience, and will fit the most fastidious person. Explanations accompany each Pattern. Patterns of four different styles of Suits are now supplied, viz.:

1—Flannel Combination Suit (shirt and drawers in one) Pattern, post paid..30 cents
2—Cotton Combination Suit (shirt and drawers), Pattern, post paid.....35 cents
3—Excelsior Suit (waist and drawers in combination) Pattern, post paid..40 cents
4—Waist and Skirt, close-fitting elegant combination, Pattern, post paid.. 50 cents

Nos. 1 and 2 are suitable for children as well as grown people. Nos. 3 and 4 are for Ladies especially.

THESE STYLES OF UNDERCLOTHING FOR Ladies have been designed by all who have used them, the most convenient and comfortable, as well as economical of any now in use. Models were exhibited and attracted much commendation at the late Fair.

Patterns can be had by applying to **Mrs. Herring**, east side of Ninth street, between St. John and St. James streets, San Jose, (where samples can be seen,) or by addressing

C. C. C. Company,

Box 686 San Francisco.

This reform underclothing has been worn by the Editor's wife and children for the past two seasons, and is certainly superior in points of comfort, healthfulness, and economy of wear and material of any ever invented. They are the invention of a California lady who makes every pattern herself and writes full directions upon each. No family that once tries these styles of clothing will ever go back to the others.

THE SINGER

SEWING MACHINE ROOMS.

Over 146,000 more Singer Sewing Machines sold in 1875 than by any other company.

The GOTHIC VENTILATOR and CHIMNEY TOP

Dealer in Stoves, Kitchenware, Architectural Work, Pipe, Patent Pumps, Valves, Etc.

HAS PROVED A COMPLETE Success in curing the most obstinate, sluggish and smoky chimneys. It stands on the top of the chimney, and does not require a smokestack to carry it above the surrounding buildings.

It is the only Chimney top that will work satisfactorily when surrounded by high buildings. For ventilating Elevators, Machine Shops, R. R. Depots, Car Shops, etc., it is unrivaled.

N. B.—Send inside measurement of top of chimney or ventilating shaft.

All Chimney Tops guaranteed to give entire satisfaction, and if any should fail after a trial of two months we will cheerfully refund the money.

FLAX CULTURE NEAR SAN JOSE.

If our farmers would get out of the rut of eternal wheat culture, and try a little diversity of cropping, they would find it to their advantage. Mr. J. H. Flickinger, who owns a fine large tract of land east of San Jose, has the past season, on 100 acres, produced 1220 centals of No. 1 flaxseed, worth 3¼ cts. per pound. The cost of cultivation was no more than for wheat. $39.60 cents to the acre is a good deal better than his neighbors have done with wheat, as all will admit; but still, little better than any of them might have done with flax, with proper care and culture. The flax was all contracted for in advance. The seed cost four cents per pound; 35 lbs. of seed to the acre is sufficient.

The oil mill in San Francisco has to import nineteen-twentieths of all the seed they use, owing to the stupidity of our farmers, who could grow it with profit by rotating with wheat and barley, making each crop better for the culture.

Mr. Flickinger kindly took us in his buggy on a bright, beautiful morning last month, to visit his farm, showed us all over it and told us much about his experience in farming. His farm lies adjacent to the mountains, and has a beautiful slope, commanding a grand view of our valley for a long distance. It is well watered with a living stream, is covered with a deposit of alluvial from the hills, and would make an excellent fruit farm, or several, as it contains near 1,000 acres. It was on this gentle slope that Mr. F. raised this crop of flax.

The following we give as his experience and dictation.

PREPARING THE GROUND.

He plows immediately after the first rains, turning under the newly sprouted weeds, plows well, and harrows immediately, and cross harrows, thoroughly pulverizing the soil, as the main feature is to mellow the surface for a seed bed. Then again in about two weeks, when the weeds and mustard are sprouted, harrows again twice, to kill all foul growth, when the flax is at once sown and well harrowed in. He sows 35 to 40 lbs. of seed to the acre. Light alluvial soil should be rolled after harrowing in the seed; but on heavy adobe rolling would be likely to do more injury than benefit.

TIME OF SOWING.

By all means sow early. In the interior counties, San Joaquin and Sacramento valleys, also the Santa Clara valley and Salinas valley, flax should be sown from the first of December to middle of January—not later than January 15th. Flax must make its principal growth before April 15th, to insure the perfect filling of the bolls, which should contain 8 to 10 plump seeds each. They must fill before the hot weather to obtain a large yield of good seed. By sowing early the flax will mature during the first hot weather, in April or May, and make heavy seed, rich in oil, whereas if the sowing is delayed till March the flax most make its growth during hot weather, and cannot evenly and properly fill and mature. Mr. F. sowed some flax this year as late as March, which was a failure. While some was ripening the rest was in blossom, and even now the old stubble is some of it green. The early sown all ripened together. Some farmers have objected to sowing early, on the ground that the frost will injure it. Mr. Flickinger declares that it is as hardy as wheat or barley in this climate, and that even if it were not, he should take the chances on early rather than late sowing.

HARVESTIMG FLAX.

The clipper is preferred for cutting the flax, as the most expeditious and cheapest mode of cutting and stacking. Reaping makes too much extra work in gathering and stacking, besides shattering out the seed in loading and hauling to the stacks.

THRESHING FLAX.

This is a business few farmers are familiar with, and one that requires particular attention to save the seed effectually. In the first place, you must not have less than eight rows of concaves in your cylinder, and they must be minutely adjusted and fitted, so as not to grind the seed. Then the thresher must be free from cracks or splits, otherwise the seed will run through like water and be wasted. The vibrator supplied with flax-seives—square mesh No. 7—is undoubtedly the best machine to do good work in threshing flax. It leaves the seed in a cleaner condition than any other requiring less after work in recleaning with the fanning mill.

FANNING MILL CLEANING.

One of the very essential things about flax growing is to put clean seed into market; No. 1, plump, clean, oily seed that will give satisfaction to the buyer, and bring the best price. Mr. F. has found, after a good deal of patient experimenting with several mills, and going to a good deal of expense in the matter, that the Nash & Cutts No. 2 machine is the best. rigged out with screens, as follows: Take out the lower cheat screen and substitute in its place the mustard screen, which will take out all small seeds. Take off two upper screens, and in their place put on top square mesh No. 7, which will carry off wheat and oats, and in place of second screen, a Square mesh No. 6. Next replace the whole combination to prevent the flax from blowing over behind the machine. If not very foul a No. 2 machine will clean in good merchantable condition from 100 to 150 sacks of seed per day with two men. For very foul seed, Mr. F. and his intelligent workmen have rigged on an attachment, a supplementary shaker, with two screens, which completely cleans out all oats and other foul seed that runs over in fast work from the short screens above.

RAISING CLEAN SEED

Is important. While the flax is growing men must go into the field and pull out all large weeds, such as mustard, wheat, oats, barley, etc., for instance. If neglected the flax will be shaded in its growth and not fill well. It will not be as rich in oil, besides being foul and difficult to clean. A lazy farmer, one who would rather shake dice in a whisky saloon in town than bend his back on his own farm, is not the fit man for this business. No energetic man will stand back because there is work about it, and it requires care in growing and harvesting.

AS TO THE SOIL.

Mr. F. declares that any good soil that will grow wheat or barley will produce good flax in paying quantities, if kept clean from foul growth, and sown early enough.

AS A ROTATION CROP.

A gentleman in Hollister who one season grew on one half of a field, flax, and on the other wheat, and the next year sowed wheat over the whole field, found that the part covered the year before with flax yielded between three and four sacks to the acre more than the portion previously covered with wheat, doubling the profits. The above facts from Mr. F. we believe should be of value to every grain grower in California. They are the result of practical experience and observation of an intelligent and energetic business man and farmer. One word as to his stock. Mr. F. deals largely in beef stock, buying and selling. Every season he raises several acres of beets, which he converts with other feed into beef, with an immense profit. We have not his figures, but readily accept his assertion. He has also some fine Durham milk and beef stock on his farm, and a lot of horses such as are serviceable. His farming is a mere pastime, as it were, but shows some system and success.

POISONING SQUIRRELS.

Squirrels, which come in from the hills at times like an avalanche, are here poisoned by the host. Sweet apples are cut into eight pieces each and charged with strychnine, by making an incision through the skin and putting the poison into the center, then the pieces are dropped into the holes. Sweet apples are ravenously eaten by the rodents, and this way of fixing them is pronounced a dead shot.

A slothful farmer in such a position might starve, where only energy is required to gain wealth. Mr. F. anticipates making valuable improvements on his farm, which, as we said before, is an excellent locality for an orchard, even of semi-tropical fruits, which we believe would succeed admirably under a sheltering wind screen of Monterey cypress.

Mr. Jack Chamberlain, of Oakland, a gentleman of ability and fine address, will take the field for a tour of the Pacific coast the coming year, as special business representative and correspondent of the CALIFORNIA AGRICULTURIST. Anything that our friends can do to aid him in gaining information and patronage for the CAL. AGRICULTURIST will be gratefully appreciated by the Editor.

PATRONS OF HUSBANDRY.

Lectures.

The Lecturer of the State Grange, Mr. Blakey Pilkington, of Santa Cruz, will commence a series of lectures to the Granges in this State this month. The programme as laid out for December is as follows:

Dec. 12, at Petaluma—Petaluma, Sonoma, Bennett Valley and Santa Rosa Granges.

Dec. 14, at Napa—Napa, St. Helena, Yountville and Vallejo Granges.

Dec. 15th, at Suisun—Suisun and Rockville Granges.

Dec. 16, at Elmira—Elmira, Vacaville, Buckeye, Binghampton and Dixon Granges.

Dec. 18, at Woodland—Yolo, Cache Creek, Fairview Valley, Antelope, Capay Valley and West Grafton Granges.

Dec. 19, at Sacramento—Sacramento, Elk Grove, Florin, Enterprise, Cosumnes, American River and Franklin Granges.

Dec. 21, at Yuba City—Yuba City, North Butte, Marysville and Wheatland Granges.

Dec. 23, at Chico—Chico and Nord Granges.

Two lectures will be given on each date, as above. Granges should turn out handsomely, as the subject matter of these lectures is of great importance to the order, and should be well understood. Mr. Pilkington is an agreeable speaker, well informed, and thoroughly in earnest, and the Patrons of Husbandry have been very fortunate in securing his services.

Special Notice to Delinquents.—The January issue will be the last one sent to such subscribers as neither request a continuance nor pay in advance. Please bear this in mind. We will be willing to wait a while on our friends who cannot pay at once, but we must know who by their orders. Because we shall stop sending the paper to those not ordering is no sign that we shall not hold every delinquent to his account.

We shall have an active agent in the field to canvass the State, write up its most interesting features, and go for delinquents. We only ask our just dues, and in every case this we shall expect and demand.

Horticultural.—We have devoted an unusual amount of room to horticulture this month, because it is the season to plant trees, and must be of more interest to the majority of our readers than any other subject. Next month we will have something on forest and grape culture, with a diversity of deparments.

THE "Intellectual Subsoiler," advertised in this issue, has been in constant use in our office for years. It goes to the root of words and ideas, and turns up definitions and synonyms properly spelled.

THE original poem in this issue is worthy of a nich in the temple of fame.

EDITORIAL NOTES.

Bound Volumes.—We shall get a number of volumes of the AGRICULTURIST for 1876 complete, saved for the purpose, bound. Several of these will be for sale at the subscription price, added to the simple cost of binding.

Missing Numbers.—We have a few papers of different months, back numbers, that will be supplied to any subscriber wanting them to fill volumes where numbers are missing. You who have saved your AGRICULTURIST for reference will please look them over, and if any numbers are lacking, order at once. We will supply free of cost as long as we have them.

"Aunt Polly" and her young folks have our thanks for the interest they have added to the AGRICULTURIST. Boys and girls make men and women in a very few years and we like to have them try to make good ones. There is no better way than in doing right generally and taking particular interest in such good reading as Aunt Polly and her contributors furnish to our columns. It wont hurt us older folks to read the Boys' and Girls' Department either. We can waste time much less profitably, to say the least.

"Jewell" gives valuable hints this month to mothers about dressing babies. We note one point: That delicate babies are the ones that wrong dressing and neglect kills off. It is a fact well known to breeders of fine stock and poultry that the best breeds have the tenderest young. Will not the same rule apply to human beings? We believe that the laws that govern physical life in one case apply to the other: that the babies which require the best treatment, the tenderest care, to live and thrive, are likely to make the best men and women. The young of the lowest orders of life need little care; the young of the highest orders require much, and the finer the organization the more care and attention to its wants is necessary.

Our Premium Certificates.—Those of our subscribers who have obtained that elegant American Chromo, "Beatrice Cenci," the subject of our last Premium Certificate, will be gratified to learn that our Certificate this month has for a subject a chromo fully up to the last one in merit and value. All we can say is, those of our subscribers who want first class chromos should not lose these opportunities we are now offering. "Beatrice" is a lovely picture, and grows more attractive on acquaintance. This month's "Fruit Piece" is a real work of art. The California Art Publication Company are doing more for us than we really expected, and we are so well satisfied that we gladly pay our share of the expense. We would call your attention to their advertisement in our paper this month, and can add that we feel fully warranted in endorsing them in all they say.

On the Chinese question our opinion is again asked, as though we could settle it we suppose. Well, at any rate, our mind is settled that the Chinese among us are a greater curse than blessing to us. The rich may like to increase their riches, and be waited upon like lords by the Chinese menials But industry and enterprise is not benefitted by their aid. Our working men and women are not encouraged by their presence. Labor is not made more honorable, nor capital less exacting: nor is equality and good will and general prosperity fostered. Aristocratic tastes and tendencies are not on the decrease in communities where Chinese laborers are employed; and odious distinctions between the rich and the poor—the man who labors and the man who lives from others' labor—are not becoming less odious. The rising generation hold in no higher estimation the grand idea that LABOR IS HONORABLE. We believe in universal equality and freedom, and cannot admire a system which treads down the poor, makes labor slave, creates a privileged class, and demoralizes society. This we think the Chinese element amongst us is surely doing all the time, with no compensating benefits. Hence our aversion to it.

A Valuable Volume for Reading and for Reference—The bound numbers of the CALIFORNIA AGRICULTURIST for 1876, with the index issued this month. Look over this index and see what a variety of useful and interesting topics are treated upon. Examine the articles and see how practical and entertaining they are. The AGRICULTURIST is not made up of a jumble of trash, picked up at hap-hazard from other journals. It contains a mass of original matter by writers—earnest, intelligent persons—who write because they have something to say worth putting into print. The editorial articles have been written with an eye to the wants of readers; to utility and sound principles. The selections have been carefully chosen with reference to their value, adaptability to our wants, and general or special interest to readers. They have been gleaned from extensive reading of the best literature upon such subjects as the departments and headings will indicate. There are many able pens in the world devoted to the service of mankind, many able agricultural and household journals, and we have found much more good than we could use, and so have given only the very cream to our readers. All this has required a deal of constant, laborious, yet pleasant attention—much more than any one unacquainted with such work can well imagine.

Manuring the soil is best done in the Fall or early Winter. This is a matter that certainly deserves more attention than most farmers in this State give it. Stable and yard manure is beneficial on any soil, and particularly so on dry uplands and heavy soils If plowed under in a coarse condition, in lumps, it will not help make a crop the first year, but will cause all the earth above it to dry out, or "burn out," as some express it, during the dry season, on dry land not irrigated. In our climate, always apply the manure to the surface. You can plow before you spread on the manure, if you want to, and harrow the manure and soil together. This is a good plan, but do not turn it under until it has lain upon the soil one season. Straw and manure will rot upon the surface, when mixed with surface soil, much quicker than when plowed under. This is on the same principle that a piece of board, or a fence post, lying upon the ground or partially covered with earth, will decay sooner than if buried completely under the soil. You all know how much sooner a fence post rots off at the surface than it will a few inches below the surface Manure and straw upon the surface act as a mulching to save the moisure in the soil from being taken into the air, and while it decays sooner, serves a double purpose, viz; enriching the soil and protecting the moisture of the soil. It is a benefit to stir the manure with the surface soil but an injury to plow it under in any upland soil not irrigated. Where irrigation is practiced, or on low, moist soils, it makes not so much difference whether it be plowed under or not.

Sumac.—Last season Mr. Jabob Eberhardt, tanner, Santa Clara, left a sack of sumac seed with us for distribution. A note in the AGRICULTURIST attracted calls enough to exhaust the supply. We wish each one who got seed to report, whether successful or not. Mr. Eberhardt, who is a very energetic and successful man, and a practical and scientific tanner, wishes to see the sumac cultivated on this coast. He asserts that there is money in it. There are nearly 300 tons of sumac used on this coast by tanners annually, which costs here about $150 per ton. The best sumac is cultivated, and comes from Cicily. The wild sumac gathered in the Eastern States is only worth about two-thirds as much as the cultivated Cicily. At $75 to $80 per ton, sumac could be very profitably cultivated on this coast, and the consumption at this price would be double what it now is at $150 per ton. The finest and softest leather is tanned with sumac. The French calf, for instance, so renowned for boots, can not be prodnced in America in competition at the prices now demanded here for sumac. Sumac is as easily propgrated from roots as blackberries. Once get a good stock of roots, and acres could be planted. It is thought that it can be annually cut with a mower or header machine after once properly rooted in the soil, and that the level chappared lands will produce it abundantly, and that Yankee ingenuity can, with machinery, easily compete with the cheaper labor of Cicily. At any rate, we hope with Mr. Eberhardt, to see it soon tried here on a liberal scale.

Released from Custody.—In the District Court, on Saturday, November 18th, F. E. Spencer, attorney for Mrs. Emily D. Austin in the divorce suit in which O. N. Austin was defendant, made a motion to the effect that the order heretofore made imprisoning the defendant for contempt of court be vacated, and the defendant discharged from custody. the order was accordingly made and Austin was set at liberty. The history of the case is as follows: In the month of August, 1872, the plaintiff, Emily D. Austin, married the defendant. Their married life was not a happy one; and in February, 1873, Mrs. Austin left her husband's roof on account of alleged harsh treatment, and in the following month brought suit for divorce on the ground of extreme cruelty. Austin was then and had been for many years a well-to-do farmer and orchardist, residing near Santa Clara. After several postponements and continuances the cause came up for trial at the January (1874) term of the District Court, resulting in the disagreement of the jury. The next trial took place at the September term of Court in the same year, and a verdict was returned in favor of the plaintiff. Austin had been paying for some time prior to this action, by order of Judge Belden, $30 per month alimony. After the verdict had been rendered the Court ordred him to pay to the plaintiff the further sum of $938, for expenses incurre in the suit, etc. He refused to comply and the Court Commissioner was instructed to raise the money by mortgaging the homestead, as the defendant had nothing "in sight" that could be attached. The banks refused to loan the money without Austin's signature, and the commissioner so reported Judge Belden then ordered the obstinate Austin to make a promissary note and mortgage and raise the money, and defendant still persisting in his stubbornness, was committed to jail for his contempt of Court in refusing to obey the mandate of the Court. He entered the jail on the 5th of February, 1875, and up the time of his release never relaxed in the slightest degree from his obstinacy. He affirmed that he would stay in durance vile to the end of his days rather than pay the money, and there is no doubt but he would have kept his word. He was in jail 652 days.

The above statement of the case in the San Jose "Mercury" is put in a light most favorable to the prosecutors, the arbitrary Judge Belden and rapacious lawyer Spencer, who have kept Mr. Austin in prison to the damage of his business, health, body and mind, for long, weary months, because he would not consent to submit to an unjust and outrageous robbery by said "Court," in the name of "justice!"

We hope to live to see a change, and reform in this whole lawyer, judge and court business, so that it will be impossible for any combination of judges and lawyers to thus outrage and imprison an honest American citizen under any such pretense, or to hold him in any such manner. It is a power that no court should be allowed to exercise.

How at last was the "obstinate" Mr. Austin released? Was "justice" satisfied? Not a bit of it. It was by a simple turn of the wrist. Think of being at the tender mercies of such an opposing attorney, hankering for a big fee, and of such a court. Whose turn is to come next? This is a question that may well arouse any citizen. Contempt of Court, forsooth! What decent citizen can have anything but supreme contempt for any and all such Courts, judges, lawyers and all?

This matter should arrest the attention of every citizen, and should not be allowed to drop until the matter is thoroughly ventilated and understood, and such changes are made in court laws as shall in future prevent any such outrages from being even possible.

Mr. Austin is entitled to the honor and sympathy of every well-meaning citizen for his persistent adhering to his principles of right.

Poetry.

The Better for the Doing.

BY ISAAC KINLEY.

THROUGH the dim twilight of the ages,
From cycles long ago of time,
Still come the voices of the sages;
And written on historic pages
Are names of men of deed sublime.

The world doth joy, the world doth glory,
In its great names of long ago—
The demigods of ancient story
Who waked mankind from sin and wo,
Whose lives it is our bliss to know.

Arouse thee! O, my laggard spirit!
Let deeds of greatness then be thine,
And bless the world that shall inherit
Thy name, thy fame, thy great design
Of deed, or word, or living line.

If on thy name would be no blackness,
No spot of foulness mar thy fame—
Then in thy will must be no slackness;
Thy soul must be a living flame,
Undimmed by sight of sin or shame.

Think'st thou there is no living Hydra?
No monster in thy path to-day?
Ah! cleanse thou yon Augean stable,
And yon Procrustean tyrant slay—
Where all must walk, make clear the way.

WHAT IS THE REASON, dost thou ask me,
O, laggard spirit of my life!
Why to thy utmost strength I task thee?
Why struggle in scenes of strife?

I answer that thou art a human,
With soul to dare and hand to do;
And if thou wouldst but be a true man,
Must labor on thy journey through.

Thou mightst beneath the weeping willow,
On flowery beds of ease recline,
Or idly dream upon thy pillow
What blissful hours in life are thine.

Thou mightst, I grant, with little labor,
Contrive to know what others know:
As wise become as is thy neighbor,
And do, perchance, as others do.

Hath love for man or hope of heaven,
My leggard spirit e'er inspired?
Know, then, for every talent given,
That ten will be of thee required.

It is the law of human growing—
Each sturdy stroke gives strength to strike;
And this great truth is worth thy knowing—
It reaches all mankind alike.

It is a truth to all extending,
Alike to all organic things,
To him who is his power expending,
The power expended, power brings.

'Tis work, that strength the toiler gives:
For all he does he gains the more;
And struggling on each day he lives,
Is better for the day before.

From day to day his strength grows stronger,
Grows stronger for the work that's done;
And life, itself, protracted longer,
Is youthful to its setting sun.

The sailor on the wide, wild ocean,
Learns boldness when the storm-winds roar;
The soldier, used to war's commotion,
Knows naught of fear when battles lower.

And he who watches the careering
Of planets through the far, blue sky,
But sees the farther for this peering
Of his heaven-searching eye.

And so it is—the power of thinking,
Of tracing reason's endless chain—
The mind is quickened by this linking
Of fact to fact in endless train.

"Tis ever gaining in acuteness,
The mental sight doth clearer grow;
And with more logical astuteness,
Effect and cause more plainly show.

E'en so it is—the power of loving
Is stronger for the love we bear,
And every deed of heartfelt kindness
But lifts us where the angels are.

Then, if each deed that's worth the doing,
To WELL no be the golden rule,
In the vocation we're pursuing
We'll find life's labor is our school.

And praising God for work that's given,
From morning dawn to set of sun,
Grow stronger for that we have striven,
And better for the work that's done.

Each gentle thought, each noble feeling,
Doth ever make the soul more pure;
And each day's toil the truth 'a revealing
That God doth bless the noble doer.

Then hail my brother! hail my sister!
Toiling on life's rugged way;
For ye shall reap in the hereafter,
Rich blessings for the toils to-day.

SAN JOSE, November, 1876.

Welcome to the Nations.

BY OLIVER WENDELL HOLMES.

I.

Bright on the banners of lily and rose,
Lo, the last sun of our century sets!
Wreathe the black cannon that scowled on our foes,
All but her friendships the Nation forgets!
All but her friends and their welcome forgots!
These are around her: But where are her foes?
Lo, while the sun of her century sets,
Peace with her garlands of lily and rose.

II.

Welcome! a shout like the war trumpet swell
Wakes the wild echoes that slumber around!
Welcome! it quivers from Liberty's bell;
Welcome! the walls of her temple resound!
Hark! the gray walls of her temple resound!
Fade the far voices or hill-side and dell;
Welcome! still whisper the echoes around!
Welcome! still trembles on Liberty's bell!

III.

Thrones of the Continents! Isles of the Sea!
Yours are the garlands of peace we entwine;
Welcome once more to the land of the free,
Shadowed alike by the palm and the pine;
Softly they murmur, the palm and the pine:
"Hushed is our strife in the land of the free."
Over your children their branches entwine,
Thrones of the Continents! Isles of the Sea!

The Storm.

Up from mirk midnight to the dawn,
Waking, I heard the wild wind-rout,
With sobbing wail and gusty shout,
Sweep through the elms that skirt the lawn.

Those patriarchs of their race, whose leaves
Scarce murmured as the zephyrs passed,
Now groaned in concert with the blast,
And with their branches smote the eaves.

Dim broke the morn along the crags
That eastward loom above the sea,
And long processions sailed a-lee
Of vapory forms, like weird bags.

Now in one sheeted flood it rains;
But the slant wind, with headlong force,
Caught in its impetuous course,
And dashed it on the trembling panes.

Anon the sun looked through the rift,
But pallid as his sister moon
When glows on high night's sober noon,
Chasing through heaven the flying drift.

At length, uprising toward his height,
Majestic moves the orb of day,
And subject nature owns his sway,
And the spent storm attests his might.

Gone the long night's tempestuous dream,
And mountain vale and forest aisle
And earth's broad fields serenely smile,
Subdued by that all-cheering beam.

And all is still, save from afar
That one low murmur overmore,
Where the long roll bests on the shore,
And wind and wave wage war on war.

—[George Lunt, in Harper's.

A Pacific December.

O, Autumn, with thy dying smell,
So faint, so sad, and yet so sweet;
Amid the strewings at my feet,
By pattering nut and broken shell,
I feel the secret of the spell,
The dying year's in full retreat—
Forever.

Reburnished by the last week's rains
The fields recall the green of spring;
The hills decree a sharper ring;
The dews in diamonds drench the plains;
The leaves grow thinner in the lanes;
The threade upon the hedgerows cling—
In silver.

Pale, like the fading forest hair,
The slanting sunbeams straggle through;
The sky is of a fearful blue;
A pensive earnest fills the air;
And, with pathetic sweetness fair,
The wan world seems to wave adieu
Forever.

The cattle browse along the lea;
The piping robin haunts the lanes;
The yellow turning woodland "wanes."
The apple tumbles from the tree;
And Autumn, ranging through, links me
To Nature.

O pensive and poetic year,
What is the secret of thy power
Whereby my posey would flower
Between a radiance and a tear?
And yet I find no longing here
To paint what trembles to the hour
Within me!

O Eden world of hill and green,
And distant gleams of slumbering blue!
I find no lyric language true
To paint the shadowed and the seen;
O infinitely touching view,
In vain thy spirit peeps between!
The sublimities that lie in you
Evade me.

The Old Friends.

BY SARAH DOUDNEY.

Where are they scattered now,
The old, old friends?
One made her dwelling where the maples glow,
And mighty streams through solemn forests flow;
But never, from that pine-crowned land of snow,
A message sends.

Some meet me oft amid
Life's common ways;
And then, perchance, a word or smile declares
That warm hearts throb between their load of cares:
For love grows on, like wheat among the tares,
Till harvest days.

"But some are fall'n asleep;"
The words are sweet!
O, friends at rest beneath the blessed sod,
My feet still tread the rugged road ye trod
Ere yet your loving souls went back to God!
When shall we meet?

O, thou divinest Friend,
When shall it be
That I may know thee in their garments white?
And see them with a new and clearer sight,
Mine old familiar friends—made fair and bright,
Like unto thee!

Nil Desperandum.

"There is many a rest in the road of life,
If we only would stop to take it;
And many a tone in better land,
If the querulous heart would wake it.
To the sunny soul that is full of hope,
And whose beautiful trust ne'er faileth,
The grass is green, and the flowers are bright,
Though the wintry storm prevaileth.

Better to hope, though the clouds hang low,
And to keep the eyes still lifted;
For the sweet blue sky will soon peep through,
When the ominous clouds are rifted.
There was never a night without a day,
Nor an evening but a morning;
And the darkest hour, so the proverb goes,
Is the hour before the dawning.

There is many a gem in the path of life,
Which we pass in our idle pleasure,
That is richer far than the jeweled crown,
Or the miser's hoarded treasure.
It may be the love of a little child,
Or a mother's prayer to heaven;
Or, only a beggar's grateful thanks,
For a cup of water given.

Better to weave in the web of life,
A bright and a beautiful filling,
And do God's will with a steady mind,
And hands that are swift and willing,
Than to snap the delicate silver threads,
Of our curious lives asunder,
And then, heaven blame for the tangled ends,
And sit to grieve and wonder."

A Hundred Years to Come.

BY WM. O. BROWN.

Oh! where will be the birds that sing
A hundred years to come;
The flowers that now in beauty spring
A hundred years to come;
The rosy lip,
The lofty brow,
The heart that beats
So gayly now?
Oh! where will be love's beaming eye,
Joy's pleasant smile and sorrow's sigh,
A hundred years to come?

Who'll press for gold this crowded street
A hundred years to come?
Who'll tread yon church with willing feet
A hundred years to come?
Pale, trembling age,
And fiery youth,
And childhood with
Its brow of truth,
The rich and poor, on land and sea,—
Where will the mighty millions be
A hundred years to come?

We all within our graves shall sleep
A hundred years to come;
No living soul for us will weep
A hundred years to come.
But other men
Our lands shall till,
And others then
Our streets will fill;
While other birds will sing as gay,
As bright the sunshine as to-day,
A hundred years to come.

Rest at Last.

After the shower, the tranquil sun;
Silver stars when the day is done.
After the snow, the emerald leaves;
After the harvest, golden sheaves.
After the clouds, the violet sky;
Quiet woods when the wind goes by.
After the tempest, the lull of waves;
After the battle, peaceful graves.
After the knell, the wedding bells;
Joyful greetings from sad farewells.
After the bud, the radiant rose;
After our hoping, sweet repose.
After the burden, the blissful meet;
After the furrow, the waking seed.
After the flight, the downy nest;
Over the shadowy river—rest.

I'm Growing Old.

BY JOHN G. SAXE.

My days pass pleasantly away,
My nights are blessed with sweetest sleep,
I feel no symptoms of decay,
I have no cause to mourn or weep,
My foes are impotent and shy,
My friends are neither false nor cold,
And yet of late I often sigh,
I'm growing old!

My growing talk of olden times,
My growing thirst for early news,
My growing apathy for rhymes,
My growing love for easy shoes,
My growing hate of crowds and noise,
My growing fear of catching cold,
All tell me in the plainest voice—
I'm growing old!

I'm growing fonder of my staff,
I'm growing dimmer in the eye,
I'm growing fainter in my laugh,
I'm growing deeper in my sigh;
I'm growing careless in my dress,
I'm growing frugal of my gold,
I'm growing wise, I'm growing—yes—
I'm growing old!

I feel it in my changing taste,
I see it in my changing air,
I see it in my growing waist,
I see it in my snowy hair,
A thousand hints proclaim the truth,
As plain as truth was ever told,
That even in my vaunted youth
I'm growing old!

Ah me! my very laurels breathe
The tale in my reluctant ears;
And every boon the hours bequeath,
But makes me debtor to the years.
E'en Flattery's honeyed words declare
The secret she would fain withhold,
And tells me in "How young you are!"
"I'm growing old!"

Thanks to the years whose rapid flight
My sombre muse too sadly sings!
Thanks for the gleams of golden light
That tint the darkness of their wings—
The light that beams from out the sky
Those heavenly mansions to unfold,
Where all are blest, and none may sigh,
"I'm growing old!"

DEEP PLOWING.

Experience is said to be the mother of philosophy, and certainly it does teach a great many things, and ought to teach more than it does. I do not mean that mother Experience is at all to blame for any failure to teach. We ourselves sometimes fail to learn from the facts she gives us, as well as sometimes rashly jump to conclusions which the facts of our dear mother do in no way warrant.

But if experience is so valuable, as I concede it to be, you, Mr. Editor, will probably consider it a piece of impertinence to weigh my inexperience against John Smith's, or John Jones's, or John of any other of the numerous families of Adam's experience. But then, is not reason of some account? If a man should measure and then declare from experience that a straight line is not the shortest distance between two points, my reason might possibly rebel, even though I knew nothing from actual measurement.

Deep plowing is, to my mind, something like an axiom. There may be exceptional cases, as where the surface soil is underlaid by sand, but the rule is certainly in favor of deep culture. On lands liable to drouth, the reason for deep culture is strongly re-enforced. What is the Editor's opinion?

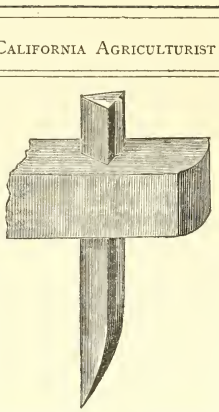
AMATEUR.

[It has taken Amateur some time to get to his subject, and one or two simple assertions is all that his argument consists of. This is not the kind of reasoning needed to convey information or show the "reason why." Experience has in many cases taught directly opposite to the assertions of Amateur. Thorough surface tillage, in a dry climate, has in many cases proved the best on soils subject to drouth. The reason why is plain. The surface tillage, by making a soft mulching of earth on the surface, prevents evaporation of moisture from the soil lying under this mulching. Deep plowing adds no more moisture than shallow plowing does to the soil. The main and desirable thing is to retain the moisture already in the soil, for the use of plants—not allow it to escape in the air.

Some claim that if the soil is deeply plowed before the rains, it will hold more water. The difference will not amount to much at any rate, for the earth will settle together if left light. In its natural condition, the subsoil is usually lighter than after plowing, because the roots of plants decaying leave it full of pores. Also insects fill it with holes. After a deep plowing it may sodden together and be more solid than ever, particularly in clay soils. Thorough surface cultivation is best for drought, and every good reason will show what experience on this coast has abundantly proven.

"Beatrice."—Such of our subscribers as have not seen "Beatrice," may think fifty cents too much money for the picture. The fact is, fifty cents is just no money at all for the chromo. We have seen it sell in San Jose at auction—several copies—in frames not worth five dollars, for $15 each, quick sale. It is a magnificent chromo, after one of the very best paintings in existence. We are glad for this opportunity of putting it into the hands of our subscribers, and no one who gets it can ever regret the trifle required to procure it.

The fruit piece offered this month is equal in merit—a really elegant affair.



THE FON DU LAC, (WIS.,) HARROW.

The cut herewith given is of a harrow tooth of peculiar construction, such as belongs to the Fon du Lac harrow, which the Farmer's Union are introducing on this coast. Mr. G. V. D. Brand, lately from Wisconsin furnishes us with the cut. We have examined the harrow and think it altogether the best one out. The tooth is of cast-steel, three cornered, with a spine on the back to give strength and hold it firmly in place. The end is brought to a fine point, as shown in the engraving. Farmers have but to see the harrow and tooth to at once adopt it as just the thing to do thorough work on any kind of soil.

Family Vegetable Garden.—Farmers generally seem to be impressed with the idea that they cannot grow vegetables for their own use on upland soils, such as are used for grain. Now we assert that it can be done, and profitably done, too. Our own experience in this State twenty years ago proved it, and we have not been asleep to the subject since We know that it can be done, and will tell you how you can have a vegetable garden at your own door.

In the first place plow your ground and cultivate it, not deep but thoroughly. If it is naturally crumbly, all the better; but if not, pulverize the clods with a maul. One acre, or even half an acre, will do for you to experiment on, if you are skeptical. Now haul upon this piece of ground a large quantity of manure. Don't plow it under, but spread it thickly over the surface, the thicker the better. It ought to be thick enough to make a good mulching. Let it lie upon the ground a couple of weeks, then harrow again to kill weeds. You may harrow the surface again after manuring, but unless you can irrigate do not plow the manure under. Now lay off the rows with a line that will reach the length of the patch, marking with the hoe a shallow trench. Plant beets, carrots, onions, peas, turnips, radishes and lettuce, any time in the month or January. Start cabbage and cauliflower plants in a manure bed made of three-fourths manure and one-fourth earth thoroughly mixed, in a place where you can shelter the plants from frosts. When large enough transplant (in January or February). You can plant mangel-wurzel beets for stock, also white Belgian carrots, in large quantities if you please. They will get a pretty fair growth before dry, hot weather, and will stand in the ground all Summer if you want to leave them till Fall, and then grow again when rains come. In planting seed, press them down, cover lightly and press firmly After they come up hoe out the weeds, and the vegetables will grow to surprise you. You can plant potatoes in furrows, covering thickly with coarse manure and straw, any time now for an early crop; also again in February for a later crop. By middle of April and first of May you can plant squashes, tomatoes, cucumbers, melons, beans, etc. But remember they must be put upon ground kept clear of weeds and other plants (unless you irrigate), or they will not find the requisite moisture to complete a growth. It will be an advantage, where sand can be obtained, to mix sand with the surface soil in both vegetable and flower garden. This is generally easy of access to most farms, in some creek bed or old drift.

Try the "experiment," brother farmer, this once. Pulverize the soil, pile on the manure, put in the seeds, and you will never again be without a home garden.

Honey.—E. H. Lewis, of Gilroy, who has been on a visit East, says that some ten car loads of southern California honey arrived at New York while he was there, and the best sold at 15 to 16 cents per pound wholesale. Probably the cost from San Francisco to New York was $50 per ton, or 2½ cents per pound. Allow ½ per cent from Los Angeles to San Francisco, and an average of 12 cents per pound will probably come at the actual value at shipping point. Here in San Jose we have to pay 25 cents for San Diego honey at retail.

The Close of the present volume and the approach of a new year, is an event in the life of the CALIFORNIA AGRICULTURIST. Never has it been on so popular and permanent a footing. Its friends are multiplied, and friendships strengthened; its field is extended, and its work grown more and more into favor and usefulness. We acknowledge the many kindly words with thankfulness, and the material aid with feelings of gratification and gratitude. The past has not been without its trials as well as pleasures. The future gleams brightly, and hope will only inspire to greater efforts and expectations. We determine that the coming volume shall be everything that a labor of constant application and love can make it.

CO-OPERATIVE SELLING.

It has been well said that more money is to be made by farmers by co-operative selling than from co-operative buying. Thus far, however, more attention has been given to co-operative buying than to co-operative selling. The bee-keepers of San Diego county have formed an association for co-operative selling. They propose to ship all their honey through this association, which will examine, grade and put up the honey, the honey cases will all bear the brand of the association, and they propose to gain a standard reputation through fair dealing. Our wheat growers could associate through the grange, or some other medium, and be the gainers. The wheat could be all subject to examination and grading as to quality and cleanliness, and proportioned in price according to merit. The shipping could be done through such agents as may be elected each year from out the members of the association for that purpose. The farmers themselves could furnish all the necessary capital, and be independent of every designing person or corporation. On the same principle our fruit growers can associate together to ship fresh fruits East; only in this case, where fruits are put up by each person without inspection, the individual brand of the growers is necessary, and accounts of value according to quality would be subject to gradation after sales. The whole scope of eastern markets could be reached and supplied through such co-operative efforts. This is a subject worthy of attention, and we are glad to see that our producers are very generally thinking upon it.

ENQUIRIES.

ED. AGRICULTURIST:—Will you please inform me where I can get some Black Poland hens, full blood, and the price of the same? And oblige,

Yours, A. FRENCH,
Salinas City.

Who can answer?

EDITOR AGRICULTURIST: *Dear Sir*—If you know any party having the "Poland China" breed of swine, pure breed, please to give me the P. O. address.

J. RATHGEB, Sr., San Andreo.

Who can answer?

A subscriber asks: "Who on this Coast is buying mohair, and what is first class mohair worth?" Ans.—No one at present. Thos. Bailey & Co, near the S. P. R. R. depot, San Francisco, are receiving and shipping to New York. They sold Stockton & Buffum's fleece last season with satisfactory results. First class mohair ranges from 60 to 90 cents, so we are informed by Angora goat breeders.

ILLEGAL VOTING.

A Remedy Proposed.

Says the *Nevada Transcript:* It is a lamentable fact that there are American citizens who so lightly regard the duties of citizenship, that they will vote early and often, and if it is necessary to commit fraud to do it, they even then do not hesitate. No good citizen desires to have such practices continued, even if his own political party gains thereby. The Marysville *Appeal* resents a remedy which we think will just fit the case and put a stop to the evil. It says: "The next Constitutional Amendment necessary to save our republic, if it is saveable, is one forever disfranchising any man who in any way corrupts the ballot box, either by voting illegally, inducing any other person to do so, or buying a vote. In the case of buying and selling, both should be forever disfranchised. Such an amendment would check the villian whose work is making honest men sick of universal suffrage.

MIND, MATTER, MONEY, BEAUTY.—Webster's Quarto Dictionary, as now published, has cost more intellectual labor, more money in its "getting up," and contains more matter, and a larger number of beautiful engravings, (3000 or more, with four pages of colored plates,) than any single volume ever before published for popular use in this or any other country. It is largely the standard in England as well as in this country. Bell & Daldy, the publishers of Bohn's libraries, are the London publishers of this magnificent volume.

Horticulture.

HOW TO PLANT AN ORCHARD.

The Best Varieties of Fruits for a Family Orchard.

Also Some Hints as to the Care and Culture of Orchards, etc.

GOOD FRUITS A BLESSING.

ANOTHER season, promising to be favorable for orchard planting and the growth of transplanted trees, is upon us, encouraging every person who has a place to plant trees to cultivate an orchard. To advise persons who have not already all the orchard that they need, to plant trees, seems, in this age of intelligence, as superfluous. Still we know that not every one has realized the enjoyment that it gives, or is aware of the importance of a home orchard, and the value of a supply of fruits for family use. A few years back, and orchards were the exception; few persons appeciated the value of fruits for food. As the world progresses few are now to be found who would be wholly without it. No class of food has a greater dietic value than good fruits. Persons who, with other sorts of food in abundance, habitually eat largely of fruits, are seldom or never sick. There is no better regulator of stomach and bowels. Fruit of some kind should always be put upon the table, and in such quantity as to satisfy the appetites of every person. It is as nutritious, and should be as plenty and as cheap as any other food. Once habituated to it, and partaking of it regularly, no pills or other physic will ever be necessary. No indigestible pickles will be wanted, no unnatural craving for vinegar will torment the stomach. This we can say from our own experience, and that of our family. Deprive us of our regular fruit at the table, and we should soon get sick and need physic. With it digestion need never be disarranged. The best authorities teem with evidences of the value of fruit as human food. Of course we are in favor of orchards and fruits for every family and advise their culture.

OUR ANNUAL ADVICE.

Again we venture to give the best obtainable advice from practical orchardists as to the best varieties of fruit trees to plant for a home orchard, and for profit.

We find it necessary to repeat the most important parts of previous articles; in fact, we simply revise our former ones, making such corrections, additions and alterations as the experience of our best orchardists have developed. There may be some good varieties of fruit that we have not included in our list, but certainly we aim to give none but what are first-rate and well adapted to the conditions of soil and the peculiar climate of California. We do not give selections from guess work, nor in the interest of any party, but have taken the most careful pains to be as correct and reliable as possible for the general good of our readers.

THE FAMILY ORCHARD.

For a family orchard, more varieties than for a market orchard should be selected. A succession of ripening should be chosen, from early to late. A few early varieties are enough, as what are not at once consumed will decay. More trees of late sorts should be chosen, for the keeping qualities of late ripening fruits will extend the time for consumption. The best fruits for canning are neither the very earliest nor the latest varieties; and as putting up fruits hermetically has come to be an important consideration, in addition to drying fruits, more trees of a medium ripening kind are required for a complete family orchard than formerly.

FRUITS ADAPTED TO LOCALITIES.

For a market orchard but few varieties are profitable to cultivate, and they should be grown with a view of commanding the highest prices; consequently they should be only of the handsomest sorts, and such as will ripen or be ready for market at the season when there is the best demand for them. The locality and effect of climatic conditions must be considered in the matter of selecting fruits for market, and also for a home orchard. For instance, at Marysville, Sacramento, and other heated portions of our great valleys, as also in the lower foot-hills of the Sierras, the very earliest apples, pears, apricots, peaches, cherries and grapes, will bring the best prices in San Francisco, because in these localities growers can produce fruits several weeks ahead of many other portions of the State. At San Jose, and within the influence of the sea climate, such apples as the Alexander, Maiden's Blush, etc.—Fall apples—are as profitable as any that can be grown. We can get them into market after the run of early apples is over and before the Oregon Winter apples flood the market. Winter apples are also profitable to cultivate in San Jose, and in all cool portions of the State, and particularly along the coast, and also high up in the mountain regions. In Nevada they can grow very excellent winter apples. But owing to the nearness to the sea and the cool climate, San Jose is six weeks behind Marysville in ripening early apples. While the early apples that grow at Marysville are very fine, the Fall and Winter fruits grown there are comparatively inferior. At San Jose superior apples can be produced of any variety. Near the bay, currants, gooseberries, strawberries, etc., of superior quality are produced. These fruits need a moist, cool atmosphere to grow the finest. They will also do fairly in cool mountain regions, while in the hotter interior valleys few or none are grown, as they will not do so well. So great is the influence of climate on fruits that it is a matter of much importance, in connection with the demands and supply of markets, for orchardists to fully understand the nature of plants and effect of climatic conditions on fruit, growth and production.

There are special varieties best suited to dry localities. For instance where the Rambo and Wine Sap varieties of apples will dry up so as to be worthless, the Skinner's Seedling and Gravestein will do very well. The Newton Pippin will make a better apple on dry soils than the White Winter Pearmain, but the former falls off badly, while the latter hangs on in such localities.

BEST PLACE FOR AN ORCHARD.

The home orchard should be laid out with an eye to beautifying the place as well as furnishing fruit for the family. Let the orchard be a background to the residence, so as to give the home a look of completeness. It should not block a fine desirable view from the house, nor be set where it will hide the house from the best view of the highway. Let it be laid out in conformity to some matured plan and to the surroundings to the best advantage, and where it will be handy to the house.

SHELTERING THE ORCHARD.

Where there is not a natural shelter for an orchard one should be provided by planting trees—evergreens are best—on the two sides from whence blow prevailing winds. Acacia, pepper trees, and Monterey cypress are perhaps the best to plant in hedge form for shelter. It will certainly pay to provide some breakwind, and even willows are better than nothing. This matter of providing a shelter is of much importance in many sections of the country, and our readers cannot be too strongly impressed with the idea. If an orchard is laid out so as to cover more ground than the fruit trees will occupy, clumps of evergreens can be set out at intervals through as well as around it, and will more perfectly shelter the orchard, and make it like a laid out park, ornamental as well as useful. This idea might be carried out on most farms with much advantage.

PREPARING THE SOIL.

In preparing the soil for an orchard we believe it best to plow deep, narrow furrows, and cross-plow. The reason for cross-plowing is this: After first deep plowing the surface soil is underneath. It should be left where it belongs, on top. The cross-plowing brings up the most of it, and pulverizes the whole together. Harrow with long teeth weighted harrows, so as to thoroughly pulverize the soil. At any rate, let the pulverization of the soil be perfect, whether you plow deep or shallow.

AFTER CARE OF THE SOIL.

As to the after care and treatment, keep the surface of the soil throughout the orchard loose and light, and free from weeds, all through the season, and especially during Spring and Summer. Never sow grain or grass in the orchard, no matter who advises it. If the land is naturally moist, or can be irrigated, vegetables may be planted and kept cultivated between the rows; but on dry soil, let the trees have all the advantage of clean, well pulverized soil, so that they can resist the drouth of Summer and grow rapidly. An orchard stunted while young can never fully recover. A bearing orchard should be liberally manured, always upon the surface. No matter how coarse the manure—it will answer as a mulching until it decays. Never plow a bearing orchard deeply. A shallow plowing may do to turn under a growth of weeds, but it is better to not allow the weeds to grow. Cultivate it thoroughly and work the surface often enough to destroy all weeds.

LAYING OUT FOR AN ORCHARD.

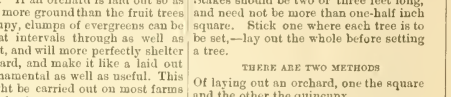
Lay out your grounds so as to set all trees (if for a family orchard) at uniform distances, to facilitate cultivation. Some trees will bear to be closer than others, but for a home orchard calculate to have all trees between 15 and 20 feet apart. On rich, moist soil, and in a sheltered place, the trees should be set further than on poorer soil in an exposed situation. The experience of our orchardists causes them to generally agree in the practice of closer planting than is advised by eastern fruit-growers. We think 16 feet far enough for any fruit trees. The training should accommodate them to that space, and the fruit will be all the better for it.

To make true lines and set trees in perfect line, is much neater than careless planting. As an aid to this, a long wire with marks made by twisting on sticks securely at regular distances we have found to be an excellent line for staking off an orchard—a twine will stretch too much. Find a base-line for one side of the orchard, then get a true right angle at one end, cornering on the first line. Stake off these lines at the right distance for the trees; then, by setting the wire by the stakes of either side and run ing parallel lines, sticking the stakes at each mark on the wire, the rows will come perfectly in line without any squinting or laborious sighting with the eyes.

Usually there is not care enough taken in laying off the ground and staking. It is looked upon as lost time. This is a mistake. A day or two spent in staking off is well-spent time. You will find it out to your sorrow if you do not work deliberately at this part of your job. Stakes should be two or three feet long, and need not be more than one-half inch square. Stick one where each tree is to be set,—lay out the whole before setting a tree.

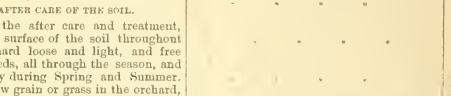
THERE ARE TWO METHODS

Of laying out an orchard, one the square and the other the quincunx.



THE SQUARE

is by drawing straight lines across each other at equal distances, like a checkerboard, and planting the trees where the lines cross each other.



THE QUINCUNX

Is formed by planting one row on the cross lines and the next between the cross lines. But in order to get the trees equidistant a little figuring must be done. For instance, if you want your trees just 16 feet apart, lay off your rows 13 feet 10 and 6-15ths inches asunder, and plant your first row of trees 16 feet from each other. The first tree of your second row plant 8 feet from your starting line, and then go on 16 feet apart as in the first row. Begin and plant your third row as you did your first, and the fourth as you did the second, and so on, breaking joints, as it were, in each row. This will give you a true quincunx, 16 feet apart in every direction.

For trees 20 feet apart, lay off the rows 17 feet 4 inches and plant the trees 20 feet apart in the rows as before explained.

The quincunx makes a beautiful orchard and is a very good arrangement, for it enables one to fill up his ground neatly and profitably, and does away with the necessity of his cultivating a single foot of unoccupied space.

DIGGING HOLES AND PLANTING TREES.

Some object to the word *hole* as applied to tree planting, but we regard it as a good word, although a badly dug hole is an abomination. There seems to be some difference of opinion among good orchardists as to how trees should be planted. All seem agreed that in loose soil large holes are not needed. Make the holes only large and deep enough to take the roots at the natural depth without cramping. Let the hole be a little the deepest at the edges and highest in the centre, so that the roots will incline a little down as the tree rests upon the bottom, or bed. Dr. Strentzel, of Martinez, says that large holes in heavy clay soil are indispensable. In this case make the bed under the trees with surface soil well pulverized. In all cases be sure that each root is laid in a natural position, and that

nothing but clean earth is placed in contact with the roots, as manure or trash of any kind induces a mold or fungus growth that is poisonous to the tree. What we said last year as to the matter of planting trees we repeat. There are a great many hobbies that are passing current as coin in orchard matters that should be exploded, which are yearly repeated by nurserymen and newspapers about digging immense holes and putting trash under trees, etc. Don't put manure or other trash under your trees when you plant them. Put no manure or rubbish into the holes about the roots. You can put in lighter, sandier soil, when planting trees on clay land, to good advantage. Plant the tree at about the same depth as it grew, in *clean* soil, laying the roots in a natural position pointing a little downward. You may put all the manure on the surface, after the tree is planted, that you please, but remember, never put manure next to the roots for fear of rotting them, nor under the tree in our dry climate, as without irrigation it would dry them up.

A TREE-PLANTER.

Usually it takes two men to plant out trees; one to hold the trees in position and one to fill in the soil. It is also found to be difficult to set the tree in the hole exactly where the stake stood before the hole was dug, and the orchard is set out of line in spite of all care. A simple implement can be made in a few minutes that will make true work—a triange made of strips of board three or four feet long, solidly fastened at the corners. Place one corner of the triangle at the foot of the stake, and, as it lays on the ground, stick wooden pins at the two other corners. Remove the stake and triangle, and after you dig the hole you will find that you can replace the stake exactly in true line by laying the two corners of the triangle at their respective pins, as at first. A triangle with solid pins a foot long at two corners to hold it fast to the ground, and a clasp or strap to hold the tree in positson at the third corner, can be set in position to the stake and the tree be held while it is planted. In this way the trees can always be planted exactly in row, and with much less labor.

Tread the soil firmly about the tree, so that the winds shall not shake it loose in the soil, particularly where the soil is light. In dry soil a good watering when planted is good, particularly when the trees are planted late in the season. We advise early planting by all means, when it can be well done. Planting late is better than not to plant at all.

HANDLING AND SELECTION OF TREES.

Selecting the trees is a matter of very much importance. Let every tree be of healthy growth and of symmetrical form. Stunted trees, or such as look bad in the nursery, are seldom worth having at any price. Right here we will say that to select fine trees, it is necessary to purchase trees early in the season, before the nurseries have been culled over and over again by other purchasers. Even if one does not wish to set the trees out early, it is always best to purchase early, and then heel the trees in on your own place. Nurserymen always find it to their advantage to take the tree up early and heel them in, for their own convenience of making sale. It is the best plan—does not injure the trees in the least if well done.

To heel in the trees, dig a trench 9 inches deep and 30 inches wide, stand the trees upright in this trench, as close as convenient without crowding the roots too much, and fill in the clean earth among them, shaking them and covering the roots thoroughly, so that no air spaces are left among the roots.

Do not expose the roots to the wind, sun, or drying air any longer than you can help. Careless handling, bruising and exposure is very injurious. Good, healthy, clean roots, not torn to pieces by digging up, will insure a fine healthy growth, under other favorable conditions.

PRUNING TOPS AND ROOTS.

Before a tree is planted in orchard the ends of the roots, if ragged or bruised, should be smoothly cut off with a sharp knife, that the healing may be rapid and sound. It is advised to delay the trimming of the tops of newly transplanted trees until the buds swell in the spring. Then cut back much or little as you choose, being governed by the form of the tree, and looking to the production of a fine, well formed head. Limbs that run nearly horizontally from the trunk are not liable to split off or break down, but all limbs that are growing crotched with the trunk should be removed, or they will some day split down under a load of fruit, to the great injury of the tree. It is best to remove all of the upright shoots and limbs that can be easily split down, while the tree is young, and only strongly jointed horizontal limbs should be encouraged to grow. A single upright leading stalk or stem is enough for a well formed tree. Encourage the growth of *low* spreading limbs but do not allow them to get too long, so as to bend around sideways or obstruct the use of the cultivator. The side limbs the hight that a man can reach will give the main spread to a tree to good advantage.

ENEMIES OF A YOUNG ORCHARD.

The two worst are gophers and borers. It is little use to plant trees in ground badly infested with gophers until the rodents are exterminated. And as long as they are tolerated in an orchard, there can never be success in growing trees or producing fruits. They naturally increase wherever they once get a footing in garden or orchard. Incessant war must be waged against them, with cats, shooting, trapping and poisoning. Trapping and poisoning are the sure eradicators.

The best natural preventative against borers is to shade the stem of the trees. This can best be done by winding strips of cloth about the trunk, from the ground up to the limbs. Be sure to cover the base of the tree, as the borers are most likely to attack the tree closs to the ground. Another good way is to put two clapboards on the south and west sides. Set them firmly in the ground; they will shade the trunk for years, and prevent borers as well as keep the bark fresh and healthy. The reason of this is that while the bark of the tree is cool, the borer moth will not lay eggs in the bark, and if it did they would not hatch. It is only upon such trees as get heated by exposure to the sun that the borers are hatched. Even if the borer should not attack the tree, it is damaging to the tree to have its trunk exposed to the hot sun, as the sealled bark becomes shriveled, the scalled sap is diseased, and the tree becomes bark-bound and suffers. Until your trees shade their own trunks it is best to shade them by all means. Dr. Strentzel writes us that a thick coating of paint to the stem of a young tree is the cheapest and best application to keep out borers.

Rabbits of every variety are very destructive to fruit trees. In districts where they are numerous a good tight fence should be made so as to exclude them. They girdle the trees when other green feed is scarce.

Ground squirrels will climb the young stalks of trees and eat off every bud, killing the tree to its roots. They also rob the trees of fruit. Kill off the squirrels.

Caterpillars should not be allowed to denude the young trees of foliage. Look out for this with a watchful eye.

The green aphis, the woolly aphis, and the scale insect are best kept away by washing with strong soapsuds, in which *a little* kerosene carbolic acid is put. Too much kerosene is injurious to the tree. Dry lime dust is also good for the green louse.

Allow no horses, cattle, or sheep to run in the orchard. Pigs and chickens will do no harm ordinarily. Only when pigs can get no other green feed, they may girdle the trees.

Chickens should be allowed the run of the orchard. There is no better range for them, and they will eat all sorts of destructive insects, also many weeds and seeds.

The few hints given above are the conclusions drawn from long experience and deliberate study and thought, and may be depended upon as being reliable advice.

We will now give a

LIST OF BEST FRUITS FOR A FAMILY ORCHARD.

In this list we have been assisted by some of the best orchardists in this State, and rely chiefly on the suggestions of Mr. G. W. Tarleton of San Jose, than whom there is not a more careful, thorough or better orchardist in California. His word is authority upon this subject. The number and proportion that we give is for a common family orchard. Persons planting trees for market should of course be governed by a different rule.

APPLES.

Early—Three Red Astrachan; 2 Red June; 2 White Astrachan; 2 Golden Pippin; 3 Skinner's Seedling, or Maiden's Blush; 1 Gravenstein; 1 Early Sweet Bow, for baking. The Golden Pippin is a very tart and high flavored apple, making it desirable for cooking and drying. It does not dry white as some; not so fine for market as for home use. The Gravenstein falls from the tree badly before ripening, but is fine for eating. Skinner's Seedling hangs well to the tree, is an extra eating and cooking apple, and good for drying.

Early Winter Apples—Six Yellow Bellflower; 2 Jonathan; 1 Smith's Cider.

The apples that dry white, and are in demand by the Alden factories for dessication are Skinner's Seedling, Gravenstein, Smith's Cider, Fall Pippin, Wine Sap, and last but not least, the Yellow Bellflower.

Late Keeping Apples—10 Yellow Newton Pippins; 3 White Winter Pearmain; 1 Nickerjack, and 1 late Talman's Sweet.

This makes 35 apple trees, all extra good kinds for California. There are other sorts, favorites with some. Of course we advise each person to have a tree of *his* favorite in addition to this list.

For an apple orchard for profit where winter apples ripen late, as in Santa Clara county, and keep well, the Newton Pippin is the very best one to plant. Some orchardists say the *only* one from one acre to a hundred acres would be the Newton Pippin.

This selection will make a respectable orchard for any farmer for family use. Persons living in the hot interior valleys should consult orchardists there as to what particular early varieties are most profitable for early market. For a family orchard the varieties we have mentioned are very choice, and succeed each other admirably in the very order in which we have given them.

PEARS.

Early and Late, as they come in succession. — Two Dearborn Seedlings; 1 Madaline; 2 Buerre Gifford; 4 Bartlett; 1 Sickle; 2 Flemish Beauty; 3 Buerre Hardy; 2 White Beyenner; 5 Winter Nellis; 2 Easter Buerre. There is no better flavored pear for drying or canning than the Bartlett; but owing to the softness of the core when ripe enough to dry nicely, it will not hold to the fork of a paring machine, and is not so profitable for the drying factory as the Flemish Beauty, which is round, smooth, easily worked on a machine, and is one of the very nicest drying pears. But for home use the Bartlett is the best, and brings the highest price in market of any dried pear. Last year we named Glout Morceau and Swan's Orange as desirable drying pears. But we find by further investigation, and advice, that it was a mistake, and we no longer recommend them. The Flemish Beauty is an excellent drying pear. Its shape is round and smooth, it dries white, has a fine flavor, and for easy working and desirable qualities has no equal. Of this there is no mistake. The best shipping pears for Eastern markets are the Winter Nelis and Easter Buerre. At one time the Bartlett and Buerre Hardy were thought the best, but they do not keep well, and arrive there when Eastern pears are plentiful, while the winter varieties get there in a sound condition and at a time when Eastern pears are not brought into competition to lower prices.

With pears as well as apples, those varieties that keep longest should be cultivated in the greatest quantities. The Bartlett and Flemish Beauty being excellent to dry and can, should give them preference for this purpose.

The Winter Nellis is the very best flavored late pear for home market. The Easter Buerre is chiefly valued for its long keeping qualities. It lasts after all others are gone.

QUINCES.

Two Orange variety. Quinces are excellent baking fruit, and for canning, either alone or with pears. The trees should be grown like a shrub, and not be pruned up into a slender tree.

PLUMS.

One Cherry Plum; 1 Early Golden Drop; 1 Royal Hative; 1 Jefferson; 2 Columbia; 2 Green Gage; 2 Ickworth's Imperatrice; 2 Coe's Late Red. The latter plum will last till Christmas, and is desirable chiefly for its late keeping qualities. Best for canning — Green Gage. Best plums for drying, are Jefferson, Washington, Ickworth's Imperatrice, Columbia, Rein Claud de Bavey, General Hand and Royal Hative. The Columbia and General Hand are really the best, as the flesh of both is remarkably firm and substantial. The Royal Hative is a fair drying plum and an immense bearer. Soft, mushy plums are not desirable for drying, but the plum that has a rich flavor, solid pulp and is easily pitted, is a drying plum. The Quackenboss is called the best shipping plum, owing to its beauty and keeping qualities.

Nurserymen graft or bud a good many peach stocks with plums. The following kinds of plums do as well or better on peach than on plum roots when planted on light, drained soils, (but remember that for heavy soils, plums do best on plum roots,) viz: Royal Native, Yellow Egg, Jefferson, Imperial Gage, Duane's

Purple, Columbia, Rein Claud de Bavy or late Green Gage, Ickworth's Imperatrice, General Hand. The prunes all do well on peach roots in light soil, also. The plums that do *not* succeed well on peach roots are: Quackenboss, Early Golden Drop, Coe's Golden Drop, and Coe's Late Red; also the true Green Gage. The Quackenboss will grow well on peach roots for a few years, and then all at once die.

PRUNES.

Two Grosses Prune de Agen; 2 Petti Prune de Agen; 3 Fellenburg. The Fellenburg, or German Prune is the best drying prune, and is coming into high favor on that account very fast. It pits *naturally*, is high flavored with firm flesh. The Petti Prune de Agen stands second, but is rich and fine, though small. The Grosse Prune de Agen is best for shipping, owing to its beauty, size and solidity. It adheres to the pit too tenaciously to be a favorite for drying. This is what we wrote last season. But now that Mr. Tarleton's cling-stone fruit-pitter is invented, we regard the Grosse Prune de Agen as the most desirable drying and canning prune. For a market prune, it is by far the most desirable, especially for shipping to the East.

PEACHES.

Freestones—Two Early May, 2 Hall's Early, 2 Early Crawford, 2 Strawberry, 2 Late Crawford, 2 Salway; or one each if you choose.

Clingstones—Two Lemon, 2 Orange, 1 George 4th, 1 Newington. The clings are now made valuable for putting-up-fruit, by Tarleton's pitter, and may be cultivated with profit in large numbers. This list of peaches has been carefully revised to suit the San Jose climate. Persons selecting varieties for hot, dry sections of country, may choose differently.

NECTARINES.

One Hardwick, 1 New White. The nectarine is not generally a favorite for eating, but as it is smooth-skinned, like the plum, it makes a very fine fruit when dried or canned.

APRICOTS.

Two Early Golden, 2 Moorepark. Nice for cooking, canning and drying, as well as for eating. This fruit ripens before peaches, and is an indispensible fruit for succession in a family orchard. The Moorepark is the best market apricot.

CHERRIES.

Two each of Governor Wood, Black Eagle, Black Tartarian, Black Arabian, Coe's Transparent, Kentish or Pie, Cleveland Biggarean, Napoleon Biggarean. The Black Tartarean is the most profitable market cherry, owing to the regular and good bearing quality of the trees, and to the solidity and carrying quality of the fruit, which will not discolor when bruised, and is large, handsome, and of fine flavor. There is no better canning fruit than the cherry; also good dried. Do not be deterred from planting cherry trees from fear of the birds destroying them. Better double or treble the number and feed the birds. Remember that the birds want "meat as well as bread," insects as well as fruit, and that you will be the gainer to call them to your orchard, even if they eat all of your cherries. But don't be alarmed; you can manage to get a taste while they are enjoying a meal without shooting or otherwise destroying the birds.

MULBERRIES.

Black and Downing's Everbearing. Trees ornamental as well as good for fruit. This fruit ripens about the same time as the cherries. Birds are very fond of them. Plant these for the birds, among or near your cherry trees.

FIGS.

Take a variety. The Black Brunswick, White Smyrna and Brown Turkey are as good as any. The strong-growing kinds make fine, spreading ornamental trees.

ORANGES.

The Navil, St. Michel and Sicily are leading grafted sorts. Experience is yearly showing more and more the adaptability of this semi-tropical fruit to all portions of our State below the snow line in altitude. It requires shelter from winds to succeed first rate anywhere. After the tree is large enough to provide a thick shelter of leaves, it will withstand our heaviest frosts without injury. But while small it should be protected by a tent shelter made by tying the tops of three stakes together over it and wisping straw around or covering with sacking, so as to break the frosts during winter. The orange should be regarded as a most indispensable fruit in a family orchard, and for market it will pay in any warm sheltered locality. In Italy the finest oranges are grown in the coolest climate near the coast, in a very sheltered place, in light, rich soil. The orange is a beautiful evergreen tree, at any season, and when in blossom or in fruit is almost matchless for rich beauty. It is worthy a place in every front yard where there is appropriate room for any sort of large evergreen.

The same may be said of

LEMONS AND CITRONS,

Which belong to the same family. The lemon is quite as hardy as the orange. Plant some of each.

These trees being evergreens should be treated the same as other evergreens. A ball of earth should be taken up with and about the roots and be either boxed or tied in sacks before moving. In transplanting disturb the ball of earth about the roots as little as possible.

OLIVES.

The time will come when no orchard will be considered complete in California without the olive tree. What butter is to the American housewife, that is olive oil to the Spanish and Italian domestics, in those portions of the country at least where the oil is abundantly produced. It is used upon their tables as butter is upon ours; is used in cooking the same, and is an indispensable article for many other purposes, of which it is hardly necessary to make mention here. The tree may be grown as an ornamental evergreen. It is easily propagated from cuttings from one to three inches in diameter. The tree will do well on dry soil but the cuttings will grow only in moist. Include a few trees in your order to the nurseryman.

NUT TREES.

Black Walnuts—These make tall trees. It would pay any man who has a place to plant a grove of these for fruit and for timber, which is very valuable. Plant several in the orchard anyway. The American Black Walnut is the only sort worth cultivating. The "California" is of no value.

The Pecan nut is also a valuable fruit, and the timber is nearly as good as hickory for wagons, etc. It is native of a climate similar to ours, and will be a success in California.

The Hickory so far as tried appears at home in California. It is worthy of a trial everywhere.

The Chestnut is no longer an experiment. It grows finely and bears abundantly. The three leading varieties are the American, Italian and Spanish. Try a half dozen of each.

The English Walnut is really a semi-tropical nut tree of low branching habit. There is no nut of greater value for food. It is at home in California, and must prove of material value to the State. Six trees at least should be planted. The Black Walnut and so-called English Walnut and Chestnut trees are grown in nurseries quite extensively, and are easily moved at one and two years of age, and can be transplanted with safety. The Pecan and Hickory are better planted where they are to grow. Good seeds should be furnished by nurserymen and seedsmen generally.

The Almond, although a nut, partakes in its nature to the habits of the peach tree. The early blossoms are tender to frost, but it is found to do admirably in California, and quite extensive orchards are now growing in various parts of the State—several near San Jose, with success. Half a dozen trees should be included in every family orchard. The Languedoc and Ladies' Paper-Shell are good standard varieties. The former is a fine bearer and withstands the frosts best. Several new sorts of soft shells have lately been produced from seed, but we do not know which of them to recommend.

GRAPES.

More attention should be paid to family vineyards. There is no fruit of more value than the grape for food.

For a trellis plant out American varieties, such as the Sweetwater, Delaware, Catawba, etc.

A good selection of foreign varieties must include about 10 Rose Peru, 10 Flame Tokay, 50 White Muscat of Alexandria, 10 Black Bamburg, 10 Black Malvoise, and 10 Zante Currant Grape.

The white Muscat of Alexandria is the very best raisin grape. Any family can make their own raisins nicely, and send some to market. The best shipping grapes are White Muscat of Alexandria and Flame Tokay, so far as tried, for profit. For canning, high flavored grapes are best.

The American grapes are best grown from rooted plants Cuttings of all foreign varieties do about as well as rooted vines. A cutting should be eighteen inches to two feet long. The strongest new growth of vines make the best cuttings. The lower end of the cutting should be planted at least one foot below the surface and the vine be bent around or laid slanting to the surface, planted firmly in the soil, leaving one or two buds exposed above the ground. No large hole is needed. A narrow spade will remove all the earth necessary to introduce the cutting. Two men can plant an acre in one day. Lay off the ground so as to plant them about 8 feet apart.

BERRIES.

These should not be planted in an out-of-the-way place, and neglected. They will as well repay for care as anything else in an orchard or garden. Perhaps they more properly belong to the garden. Irrigate when you can.

Blackberries.—Plant 50 Lawton and as many Kittatinny. They are excellent fruit for the table, to can, and to dry.

Raspberries. — Twenty-five plants in variety. Plant blackberries and raspberries about three feet distant from each other, in rows eight feet apart. Good healthy roots should be selected; the tops will grow from the roots. Irrigation is beneficial.

Currants.—The Cherry Currant is by far the best, but a few of other varieties may be tried. 25 plants will give a family all they want. A moist soil is best for currants. If they are planted to correspond with rows of grapes, plant 8 x 3 feet, and allow the stalks to multiply in stools. It saves trouble in cultivating with a horse, to plant uniformly in rows.

Gooseberries.—Plant same distance as currants. The Houghton Seedling is the standard kind. Allow them to branch low down, and grow about as they please, trimming once each season.

Strawberries.—On almost any kind of soil strawberries will do well if abundantly irrigated. The surface soil must be kept moist. During fruiting time the leaves absorb through the roots a great deal of water. Persons who can irrigate should have a nice bed of strawberries. The Langsworth Prolific and Jocunda are standard sorts on this coast.

RHUBARB AND ASPARAGUS,

Though belonging to the garden, are standard plants, and require special care. Plant Rhubarb about the same distance apart as currants. Manure liberally, and water if convenient. Asparagus may be planted in beds, 18 inches apart, and manured heavily, keeping down all weeds. All nurserymen keep Rhubarb and Asparagus roots for sale, as also the other trees and plants above mentioned.

We invite our readers to *ask questions* upon all points wherein they want information not given in this article. We cannot pretend to give every instruction in a single article like this, but we aim to be strictly correct in what we do say.

Semi-Tropical Fruits.

The following article on semi-tropical fruits we find in the Florida *Agriculturist*. It was written by Mr. F. Branch, a member of the Florida Fruit Grower's Association. We believe it will be interesting to readers in California, as it contains much desirable information:

Much has been written upon the subject of oranges, their culture, the soil best adapted to their growth, the proper method of pruning, the diseases to which they are liable, and their cure. There is one disease which prevails extensively in this part of the State which seems to defy all local remedies. I refer to the scale insect. I have tried most of the remedies that have been recommended, and have failed with every one. I have tried diluted carbolic acid, carbolic soap, aloes, potash in solution, spirits of ammonia, &c. I have also tried inserting sulphur into the body of the tree. All have failed. That which seems to be most beneficial is thorough manuring and high cultivation. Much complaint has been made by shippers of fruit on account of a brown discoloration upon oranges (probably a fungi), which has prevailed to some extent in this region. Lime freely scattered over the soil under the trees in winter, and well raked in, has been recommended. I have tried it, and proved it a success. But why do people run mad about the one fruit (the orange), whilst another fruit, probably far more remunerating, is neglected? The Sicily lemon usually sells higher in market; will bear fruit two or three years earlier from the seed; is in constant bearing for nine months of the year; will bear transportation far better than oranges, and the tree, if killed by the frost to the ground, will grow up and commence bearing again in half of the time required by a frost-bitten orange tree to recuperate and commence bearing.

THE GUAVA

Is destined, at no distant day, to occupy an important position amongst the fruits

of South Florida. Guava jelly has a world-wide reputation, and when the fruit shall have passed into the hands of the manufacturer of jelly its real value will be appreciated. Like the Sicily lemon, it bears almost every month in the year. Although it is a semi-tropical plant, it has been killed by frost but once on my lot, in Tampa, for fifteen years.

PINE-APPLES

Are grown successfully here. I have tried them for several years past upon a small scale, and have found no difficulty in maturing the fruit every year. Like most other fruits, a rich soil is best for their growth, but they grow well upon the sandy soil of Tampa without any manure. If kept well mulched with straw, hay, or moss, they do well without culture. The spiny edges of the leaves renders their cultivation very uncomfortable.

THE PAWPAW

Is considered by many one of the most pleasant fruits grown in this region. It bears fruit in fifteen months from the planting of the seed. The fruit, grown upon good soil and well cultivated, grows to the size of the head of an adult, and the taste of the fruit bears a very close resemblance to that of the muskmelon. The fruit is attached to the body of the upright trunk by a stem three inches in length, and they grow in such a crowded manner that half-grown fruit is often forced from its position, and falls to the ground. I has no leaves except upon the top of the trunk. This plant has attracted the notice of strangers more than any other in Tampa for years past.

THE MANGO,

Although a very tender plant, has been grown successfully in this county. Mr. Matchet, of Clear Water settlement, recently sent to this market a quantity of the fruit, which was quite delicious. If planted in moist land it is very sure to be injured by winter frosts, but usually survives the frost if grown in tolerably dry soil.

CITRON

Trees grow well here. They withstand the frost well, and bear abundantly a fruit of very largy size, not edible, but used for making very valuable preserves.

THE LIME

Tree flourishes here. It bears the smallest fruit of any of the Citrus family, yet contains more citric acid than any other of the family, and will one day enter largely into the fruit culture of South Florida.

But what shall I say of the

SUGAR APPLE?

I wish I could send a large ripe apple to each member of this Association. In this fruit is realized the fullness of the saying, "it is so rich that it melts in the mouth." I have grown the fruit for years. The tree bears the frost well; does not require very rich soil, and but little cultivation, and bears abundantly. I have never seen a person partake of them who was not enamored therewith. Unfortunately for persons who cannot visit South Florida, their mouths will water in vain for sugar apples, for they will not bear transportation.

THE ALLIGATOR PEAR

Grows here luxuriantly. Large quantities are now ripening and falling from the trees. The trees are from fifteen to forty feet high. The fruit is pear-shaped—four times larger than a bell pear. The edible part is the pulp surrounding a very large seed, and is prepared by shaving or scraping off, seasoning with salt, pepper, and vinegar, and is very much admired by those who have acquired a taste for it.

But one of the most useful fruits which grows in South Florida is the

BANANA.

In some places it supplies the place of bread. Still it is not the bread-fruit tree so eloquently described by Captain William Hendrick, when lecturing in Syracuse, New York. This plant requires a rich soil—loam, if it can be had. Its numerous small roots do not give it a firm hold upon the soil, therefore deep cultivation is inadmissible. If well mulched very little else is required. The plant is rarely killed by frost in this climate. Its fruit is exceedingly pleasant and very nutritious.

POSSIBILITIES IN FRUIT CULTURE.

The cultivated fruits of our day have all sprung from vastly inferior wild fruits. It is not claimed by scientific pomologists that any of them have yet been brought to their greatest perfection. New varieties of each kind may and probably will be produced, that will far excel anything now known in richness of flavor, nutritive excellence, beauty and value. It has taken hundreds of years of careful culture and selection to progress to the condition where we now find our cultivated fruits, and the progress is only begun. In a speculation upon the possible value that the wild fruits of America, under cultivation, may yet attain, Prof. Asa Gray thus talks before the American Pomological Society:

It would be curious to speculate as to what our pomology would have been if the civilization from which it and we ourselves had sprung had had its birthplace along the southern shores of our great lakes. The northern of the Gulf of Mexico, and the intervening Mississippi, instead of the Levant, Mesopotamia and the Nile, and our old world had been opened to us a new world less than 400 years ago.

Seemingly we should not have as great a variety of choice fruits as we have now, and they would mostly have been different, but probably neither scanty nor poor. In grapes, at least, we should have been gainers. Our five or six available species, of which we are now just beginning to know the capabilities, would have given us at least as many choice sorts and as wide a diversity as we have now of pears, while pears would be a recent acquisition, somewhat as our American grapes now are. Our apples would have been developed from *Pyrus coronaria*, and might have equaled anything we actually possess from *Pyrus malus* in flavor, though perhaps not in variety, if it be true, as Karl Koch supposes, that the apples of the orchards are from three or four species; our plums would have been the progeny of the *Chicasa*, the Beach plum, and our wild red and yellow *Prunus Americana*, which have already shown great capacity for improvement. Our Cherries might have been as well flavored and probably not as large as they now are. But instead of Peaches and Figs, we should be discussing manifold and most luscious varieties of Persimmon and Pawpaw, the former equal to the Kaki just acquired from the far east. As to Strawberries, Gooseberries and Currants, we should have lost nothing and gained something, as we possess several species besides the European types themselves; as to Blackberries and Raspberries, we should have been better off than now, by the earlier development and diversification of our indigenous species, and we might have had all our finest Strawberries a thousand or more years ago, these having come from our American types, (*Fragaria Virginiana*,) with its varieties, (which as well as the old world *F. vesca*, occurs all across the Continent), and *F. chilensis*, which ascends the Pacific coast to Oregon.

One of the best horticultural authorities in the United States, the *Gardener's Monthly*, upon this subject says:

There is no doubt but the Huckleberry can be domesticated and raised so as to pay in a majority of gardens, especially when the fruit cannot be picked on the wild bushes or bought in the market, which is the case in the Western prairies. Mr. Hammond, in the August number of *The Horticulturist*, speaks of the different varieties of Huckleberries, that no one had given a description of the different kinds. Prof. Gray, in his "Field Botany," describes ten varieties of *Vaccinium Corymbosum*. The Blueberry of the New England States, growing from three feet to ten feet in height, answers the description of the kind described by Mr. Hammond. That there is a great difference in the quality of the berries of this same variety there is no doubt, and if we go into the cultivation of the berry let us begin with the best, and by a course of reproduction the fruit will be very much improved. Of the different native fruits of our country the grape has the most attention, and the result has been very satisfactory. The same may be done with the native Plum, Persimmon, and the native berries, all better fruits in their wild state than the Apple or Pear was. All fruits and flowers that have been brought into cultivation have been much improved. All flowers in their *wild state* are *single*. *Cultivation and reproduction make them double.* Equally as great changes can be made in the quality of our wild fruits.

Killing Tree-Borers.

Cutting them out with a knife and plastering the wound over with clay, binding it on with sacking and strong twine, is the common effectual way; but a writer in an exchange gives his method as follows, and it looks reasonable as well as less injurious to the tree than the digging out method:

"By way of getting at this 'worm of the dust' is an easier one and more effectual. I cut a sumac, or elder, one foot more or less long, punch out the pith, cut one end with a slope, hunt the borer's hole, clean it out at the entrance with a wire, place the beveled end of my tube against it, take some putty-like clay and plaster it water tight around the end next to the tree, fill with very strong soapsuds, and the thing is done. No matter how crooked the hole is, or whether it goes up or down, the suds in the tube will force itself to the end. I have tried it two years and have not failed once. Of course any kind of small, hollow tube will do, anything that will make it water-tight will do to plaster it with."

An exchange, speaking about new fruit, says:

The Persimmon tree of Japan is recommended by an Eastern agricultural society for general adoption. Members state that the fruit is much larger than the Southern fruit; that it makes a sweet and delicious preserve, treated in any of the ordinary ways. We have tasted them put up like figs, and we can speak of their excellence. The peculiarity is greater sweetness and some aroma, which require time to accommodate all tastes. Our nurserymen have the trees and we believe they thrive well.

The Paw-Paw is also recommended. It is indigenous South. The fruit is a sort of apple, and the taste is of a kind well suited to the table. Its leaves are valuable for one peculiarity: meat, however tough, is rendered tender by being wrapped in them for four to six hours. The seeds are a capital vermifuge. In California we need additions to our list of fruits. Mexico has many.

The Zapote is as large as our apple tree: its leaves are of a richer green, and its apple-like fruit is rich and mellow as a pear. Santa Barbara has a lone lady Zapote, eighty years old, and a great bearer. Like the silanthus, the male tree fertilizes but does not fruit. The lady fruit is imperfect because no male attends.

Something About Oranges.

California's Orange Crop and Market.—The average crop of Oranges in this State is about 5,000,000, while the average consumption is about 10,000,000. In other words, we have a home market for double the number we produce. In the face of this fact, it has been frequently proven that orange culture is by far more profitable than the culture of any other fruit produced in the State. While our fruit-growers are exercising their brains to discover a channel through which to place their surplus apples, pears, peaches, plums, etc., into a good and paying market, would it not be well for them to turn their attention to the production in greater quantities of those kinds of fruit for which there is a good market at home? Again, of the thirty-six States now in the Union there are but two or three in which oranges have been produced to any extent, while California is undoubtedly the best orange-growing State in the Union. Allowing the average consumption of all the States to be 10,000,000 oranges annually—and it certainly is much greater—the United States presents a market for that fruit equal to 360,000,000. Here, then, is a fruit market that it is worth the while for our fruit-growers to look after and supply. Another consideration in this connection: it needs no Alden process or any other to prepare the orange for market. Another is, that the tree once in bearing and well taken care of will continue to bear in increased quantities and of improved quality for a lifetime. Another is, that the foothills, where land can be had in abundance for $2.50 per acre, is the best place in the State for orange culture as well as for the culture of most other varieties of fruit.—*Record-Union.*

Inferior vs. Good Fruit.

The sure result of careless culture is poor fruit. Trees are likely to produce more fruit sets than will come to the highest perfection of pulp growth, in our prolific climate. The following from the San Francisco *Chronicle* is sound upon this subject:

A large amount of fruit rotted under the trees this year for want of a market—not the best fruit, of course, but where there is such a crop as the present only the finest can be sold. Even the fruit canners and dryers will not purchase small and inferior fruit, and as the San Francisco market is supplied, this class of fruit must either rot or be fed to the hogs, and as there are generally no hogs to feed it to, it rots. This is the result of carelessness. We have seen trees loaded down with apples that looked

to be not more than half grown, the branches broken by the weight, and the crop almost a total loss for want of a market. A little time spent in pruning the trees and thinning the young fruit would have saved the trees and caused the fruit to grow to perfection. Such is economy as practiced by some of California's farmers. This is probably one of the main reasons why there is so much inferior fruit in the State, and it is this class of orchardmen who talk about digging up the trees and sowing the ground to wheat. If the trees are not of the right kind, it is an easy matter to graft them. If they are too full of blossoms in the spring, the fruit buds should be thinned out. Formerly the culled or inferior fruit could be dried or canned. Not so now. The State is supplied with good fruit, and the man who spends his time paring small apples or scrawny peaches, and dries them in the sun, will find his time wasted. There is a market for fancy fruit for shipment, for local consumption and for various purposes, but there is no provision for an inferior quality.

Fig and Almond Culture.

The following from the *Rural New Yorker* we give place to as encouraging the culture of almonds:

The cultivation of the various fruits adapted to the climate of the Northern States have been extended until our markets are fully supplied with all, very few, if any, being imported. But the same cannot be said of the Southern States, for although the climate seems to be especially adapted to the culture of the fig, almond, orange, lemon and other tropical fruits, still we look in the main to foreign countries for a supply.

Why should we import millions of dollars worth of figs and almonds while the Southern States could readily supply our markets? Is it for the want of a proper knowledge of their culture and lack of energy, or scarcity of labor? Of course, it is not for us up here in the North to answer these questions, as apples, peaches, pears and similar fruits mainly occupy our attention. But it does seem to us that the people of the Southern States ought to be able to supply us such easily raised fruits as figs and almonds as cheaply as they can be bought abroad, counting in the cost of exchange, freight, insurance and other unavoidable expenses.

Some of the varieties of the almond succeed as far north as the most hardy sorts of peach, but these are rather inferior; besides, there is really no certainty of obtaining a crop. The finest sorts, like the long hard-shelled and ladies' thin-shelled, are rather tender, and can only be depended on in a warmer climate, say North Carolina and southward.

These varieties are as readily propagated as the peach, and the trees are not only quite similar, but are liable to the same diseases and insect enemies. A warm, dry soil is best, and if quite rich, so much the better, not only securing a good crop of fruit, but long life to the trees.

The finer varieties, such as we have named above, may be propagated by budding, upon seedling almond stocks, or upon peach and plum, the latter being preferable in localities where the peach tree borer abounds. The plum stock, however, has a tendency to make the trees somewhat dwarfish in habit, but this is not objectionable so long as the vigor and productiveness of the tree is not impaired by its use.

When the almond is ripe the flesh or pulpy covering of the nut dries and cracks open, permitting the former to drop out. A man who raises almonds is not obliged to send them forward to market on a certain day, as with peaches, or lose his crop, but they can be gathered and held for weeks or months if necessary, to secure a good price, and this is an advantage which should tend to increase their culture, especially in localities not contiguous to good facilities for reaching the markets in our large cities.

Semi-Tropical Fruits in the Foot-Hills.—One can hardly name anything that would not grow to perfection in these foot-hills. We have on our table an olive twig, with several fine olives, fully ripened, a beautiful cluster of oranges, as large and fine as any we ever saw, and a sprig from a fig-tree, also covered with ripe and luscious fruit. These twigs were all cut from an orchard at Ophir, the 17th day of December, and the fruit on them is as well developed, fully ripened, and highly flavored as any that grows in the tropics. In the same locality is a great variety of fruits and nuts. Among the latter are the English walnut and the pecan, both of which do well. Along with the fruit we have a splendid bouquet of roses, gathered from a garden in Auburn. Oranges, figs, olives and roses, within a week of Christmas, are not at all remarkable here, we know; but we think our Eastern friends could appreciate the climate that produces them, especially when they remember that by climing the Sierras a short distance, and without going out of Placer county, we can find ice six inches thick and snow four feet deep.—*Placer Argus.*

The People at Riverside evidently mean to take advantage of all their tropical resources. There are no less than 60,000 orange trees from three to eight years old, growing within the limits of that colony. There are also several thousand lemon and lime trees, some of which have already come into bearing. In all portions of Southern California the orange is cultivated as a standard market fruit. It should not be longer neglected in any portion of the state below the snow belt.

Packing Oranges.—S. F. Gard, in the Florida *Agriculturist*, says:

A word as to packing. The keeping qualities of the orange are much affected by the manner of handling in packing the fruit, and of the handling of the package after being packed, as well as by the condition of the barrel or box, in respect to fitness for use.

The fewer times the orange is picked up and laid down the better it will keep. The aim, therefore, of the orange-grower, should be to handle his fruit as little as possible, and as carefully as possible. After the oranges are taken from the tree they should be laid under cover, on a floor high enough above the ground, with the planks far enough apart to admit a free circulation of air, and should remain there at least twenty-four hours to sweat and shrink, as they always do, before they are packed. This gives time also for any bruise or damage caused by picking to show itself. All damaged ones, no matter how slight the damage, should be laid aside. Only sound ones should be packed. The packing should be done in the orchard, to prevent bruising the fruit by handling it in a loose condition too often. After the fruit is packed the packages should be handled with care. It will pay in the end. Taking all the circumstances together that bear upon the keeping qualities of the orange, as well as the price of the box or barrel, preference must be given to the box in packing. The most convenient size and shape is that of the common lemon box, holding about one-half barrel.

A THANKSGIVING STORY.

As Told by "Old Dave."

BY NELL VAN.

It was in a miner's cabin on the North Fork one bleak November night, that old Dave gave the fire a punch, and sung out: "By hokey, boys, if this ain't the last Thursday in November and Thanksgiving in old New England, as sure as I'm alive."

"That's so," said one. "Come on," said another, "let's celebrate."

"Well," said old Dave, "I'm willin'. Just name your play and I'm in for it, you bet."

A tall, freckled-faced youth, who went by the name of Ned, drew near and suggested "riddles." Another called for a "yarn," and it was finally agreed to draw lots for the one to relate a Thanksgiving story, with riddles and something to eat afterwards. Slips of paper were folded and well mixed in a hat, and the longest strip was found in old Dave's hands. A shout went around, for he was called a cute one at spinning yarns. "A thanksgiving story, and a true one, too, do ye say? Well, it's not a few Thanksgiving days that's passed over my head, to be sure; but—yes, there was one I shall never forget. You may like to hear about it. You see, lads, when I was a boy I chanced to be thrown on the world to look after myself; and farmer White, needing a chore-boy, took me in and gave me board and clothes for what I could do, intending to make a farm hand of me, which he did in the course of time. Now it's pretty rough on a youngster, naturally fond of play as I was, to be set down to hard work; but it's been the makin of me, that I *do* say. In looking about the world, you'll find that those who raise in life most generally have had to tough it in their young days, so it pays in the long run to be stood alone airly in life.

"Well, farmer White was just setting out in life; had a good farm earned and paid for; a smart young wife, and old aunt Rhoda to help see to things indoors. There was milking, butter and cheese making, pigs and chickens to feed, besides wood and water to fetch, all of which I had a hand in. 'Twas a mighty good home there at the farm for a boy like me—everything regular as clock-work, no youngsters to bother nor hinder, though just afore I came they had buried a fine boy eight or ten months old, which well-nigh broke their hearts. Thanksgivin' time came around with its usual preparations. No end to the choppin' of mince-meat and apples, and pies enough baked to provision an army. Such stacks of good things as filled the buttery shelves it fairly makes my mouth water to think on.

"Of course there was to be a family gatherin', for uncles, aunts and cousins can always be found ready to go to a Thanksgivin' feast. Turkeys and chickens were killed and stuffed, and all the good things ready the day afore hand, so that all hands could go to meetin' in the forenoon. For what was Thanksgivin' without the sermon to start in upon? Then everybody, decked out in their Sunday go-to-meetin' rig, went home for a grand feast and a good time generally. Some of you fellows here know all about that part of it, I'll warrant. How many of you here are Yankee born? Only three besides Ned? Well, I vow, I thought more on you knew what Thanksgivin' meant. Howsomever, the day wore on and evenin' twilight found as young folks all sittin' round the fire listenin' to aunt Rhoda's droll riddles and enigmas. Two on 'em I remember now just as she said 'em, stamping her foot to keep time—a way she had: 'My mammy sent we over to borrow your wimblebow, ironbow, sacritybow, wobody, lyricky, and the whirligig!'

"Well, now; that's a good one," shouted Ned, rolling backward over the floor. "Say it over again." Dave repeated it gravely, and after some guessing told them it was a spinning wheel and reel. Ned said he knew it all the time.

"Then," said Dave, "here's another: 'Up and down turnigig, such as folks pump with.' Then the laugh went round, and ned suggested a churn. "Yes, by thunder," said Dave; "born yankee, every inch on you—six foot at that."

"But the story, Dave," sung out Ned; "let's have the rest." "By all means, yes," said another.

"Well," continued Dave, "where was I. Oh, listenin to aunt Rhody's riddles, when rap, rap, rap, at the door, and before we could open it a little moan. There had been a fresh fall of snow, and sleighin' was only tolerable, but the air was crisp and prospects of a freeze. Aunt Rhody up and starts for the door, but I got ahead of her and opened it first, and what do you think, boys, sat there on the door stone? Why, a big old-fashioned band-box, such as our grand-mothers used to carry their best bonnets in when they went journeyin'.

"What's this?" said aunt Rhody, and with that the whole crowd came to the door and we fetched it in front of the fire, whilst some one lit the candle.

"What's the rampus?" said farmer White, coming in and seeing the big box tied about with a silken string, he whipped out his jackknife and slipped it, when the lid was raised, and there lay a little two-months old baby, on a pile of new flannel and soft blankets! Such a time as there was among the women folks. One said one thing and another talked baby talk. Never a word or line came with it, though we searched the box in and out, save the word Frank written and pinned to the dress front.

"He's come to take the place of the one we lost, mamma," said the farmer, gently patting his wife's cheek, as she sat in the low rocking chair looking down upon the sleeping babe that lay in her lap. She smiled sadly, as if thinking of her own white baby gone to its long home, and of the mother who was, perhaps, lost to this little one. "We will be everything to each other, darling," I heard her say as she raised the tiny face to her lips. Where can it have come from? and Why brought to the farm? were questions quite as puzzling to the grown folks as aunt Rhody's riddles had been to the children.

When the excitement had died away, and baby was laid sleeping upon the bed, the young folks had some romping games, and then cracked nuts to eat with apples and cider, before tackling up teams to go home. I mind now I tracked the footprints in the snow to the roadside where traces of wagon wheels were found, and next day the town folks had seen a covered carriage driven through in the direction of the farm, but nothing more could be found out; leastways the boy hived and was fetched up on the farm

—a bright, curly-headed little chap, with brown eyes, and hair with the least tinge of red enough to make him look saucy-like. The farmer's wife had one, and they grew up together like twins, but *so* different in every way. Then in a few years more boys and girls came along, and I mind the year I left, after haying time, a goodly crowd of small fry begged to help load hay, while staid Frank raked after.

"The Summer afore the gold fever broke out I chanced to be in that part of the country in search of work, and stopped to see farmer White's folks. They seemed proper glad to see me, both him and his wife, and Aunt Rhody too, who told me how much they all had missed me. And had I come back to stay agin? Times were busy, the farmer shorthanded, and nothing would do but I must take hold and carry 'em through harvesting. You may be sure that suited me to a dot. The children clustered around, all remembering me, but grown past my recollection.

"There was Frank, a man grown, and Jim, not far behind, while Madge, a blue-eyed, prattling, four-year-old, who had been my special pet, was now a timid, blushing maiden, with hair like spun glass floating over her bare shoulders. I thought she was the prettiest creetur I ever sot eyes on, but oh what a change a few months brought about!"

"Did she die or get sick?" asked one, while Ned looked up wistfully, not daring to speak. "No," drawled out Dave, "not exactly, but she might better have gone than grieve 'em all with her sad, sorrowful looks. Well, as I was a-sayin', I stopped there that year way into the Fall, apple parin' time. There was lots of fun around the kitchen hearth, and I was duly cautioned never to whisper to Frank or to any one about his not being their own.

"The little school-ma'am who taught the district school that term boarded around a week at a place, and when it came her turn at our house she questioned considerably about Frank, he being so very different from the rest. And I had often remarked the same, which to me seemed queer, seein' as how they all had been brought up alike. He'd sit by the hour, studyin'-like, looking into the fire, and not noticing what fun was goin' on around, or with a book he'd lie by the half day under a haymow in Summer time. Now Miss Shaw, the schoolma'am, was a studyin' up hereditary transmission—the laws of descent, or inherited traits handed from one generation to another. You know what I mean, boys. Well, in Frank she could not see a spark of resemblance to any one of the family. Getten' no satisfaction out of nobody, she was forced to set him down as a sort of freak of nature, or one of God's peculiar providences.

"There was a great temperance revival about this time, and folks went from house to house for signers to the pledge. When they came to Frank he obstinately refused to sign, saying he had always loved the smell of wine and liquor and should sometime want to taste it. He never meant to make a promise which he might be tempted to break. The others, from oldest to youngest, signed and urged him to, telling him of the terrible effects of the habit, once formed; how whole families were ruined by a father's indulgence in drink, etc. It was all to no purpose. He insisted that he could keep from forming the habit as well without signing as with it, and he never meant to bind himself by a promise. Miss Shaw looked from one to the other of the parents, and wondered how they could have such a child and not compel obedience, as she said to me.

"This was the first taste we had of Frank's willfulness, and considerable anxiety was felt, you may be sure. He was hot-headed and high strung, but easily led if rightly approached. The mother had governed with a firm hand, but gently, influencing by love rather than fear. The boy had a fashion of going to the town on horseback for the mail, and sometimes stopping by the way, as boys will, for a chat with the fellows. One night he came home raving; threw the letters upon the table, and stalking up to his mother's side (Miss Shaw was not there. I was glad of that), said excitedly: 'Now, mother, the time has come for you to tell me the whole truth. I have been taunted and sneered at all my life; been called red-head, sorrel-top, the red sheep of the family, and such, by pesky rattletraps about town. But when it comes to being called a tuckaway brought to the farm in my mother's band-box, and a red-headed bastard, it is more than human nature can bear. I've just given a fellow a clip for saying that, and expect to be brought up for it. Tell me truly, now, am I really your son, or the miserable tuck-away they call me?' Aunt Rhody here spoke up: 'Tell us, Frank, which is the true mother of the chicks, the hen that lays the eggs or the one who fetches up the brood?' and farmer White looked up from his letters to say something about the ridiculous fashion some folks have of meddling with other folks' affairs, and making remarks if all the children of a family are not exactly alike.

"All this time Frank stood looking into the saddened eyes of his mother, who rose, and putting a hand upon each shoulder, asked him if she had ever given him cause to question her love and devotion to him; had she ever shown him less affection than the others—looking into his eyes so pleadingly that the boy sank into a seat and covered his face with his hands, sobbing as if his heart would break.

"That was a sorry time at the farm. The danger of Frank's discovery haunted us like a nightmare, and to settle matters it was agreed to let him go to New York to visit a friend of Aunt Rhody's who had been at the farm that year and took a mighty fancy to him. His clothes were packed into a small trunk and he set off in good spirits, kissing all gaily and promising to send something to Madge, who was fairly crying.

"It was then I first learned the beginning of Frank's history. Squire Bell, who lived in the great house down by the meadow, had an only daughter, Fanny, who grew up handsome, and like all the rich men's gals must be sent to a fashionable boarding school. She went to New Haven, where she soon made the acquaintance of half of the students of Yale College. During vacations, when she was at home, there would be lively times at the Squire's between Fanny and her numerous beaux. But there came a time when word was sent from the seminary that Fanny was missing; it was feared she had eloped with a Yale student. The Squire packed his trunk and set off at once, leaving his wife to fix up things and close up the house and follow him. For fifteen years and more the family have been abroad traveling, and not a trace of their daughter had they found.

"There were now great doings at the Squire's old mansion, for word had come that they were to return home to spend their last days. Painters and upholsterers were at work fixin' things, and folks began to wonder whether Fanny could be coming with them. One day a modestly dressed lady knocked at our door and asked to see Mrs. White. She went into the sitting-room, and long they talked alone together.

"Then as I was knowin' to the rest, I was told after she had gone that the Squire's daughter had married a good-for-nothing gambler and drunkard. She had been left alone to struggle in a foreign land; had taken steamer for home with a young babe; came to her native town; learned that her parents were gone traveling; was taken down with a fever and was expecting to die—so gave directions for the babe to be brought to Aunt Rhody's care at Farmer White's, feeling that she then could die in peace. Her doctor ordered change of air. She rallied, got well; traveled with a former schoolmate to her home in Germany, where she hoped to fall in with her parents. A young nobleman fell in love with her, and she was induced to marry him and live in a castle on the Rhine. Her heart so misgave her for deserting her child that she could have no peace. No tidings of her parents, and she was in a peck of trouble, though her German count was as fond of her as he could be. They at last decided to travel, and at Paris chanced to meet her father and mother in the hotel parlor. A return to America was planned, and this was Fanny herself come to claim her child.

"He was expected home the next day, but did not come. Another, and still he stayed away. Then they wrote; no answer. At last, alarmed, the good man started for New York to bring him back. He was nowhere to be found; had left for home at the appointed time, and may have gone to California or the ends of the earth.

"My story's done." "But Madge," cried Ned breathlessly, "what about Madge?" Then it was that old Dave lifted his eyes, and for the first time recognized Frank in the freckled lad before him.

"Oh, she's waiting for you still, my lad. I have a letter here from her brother, who charged me if I found you out here to give you a message.

"And you are really he? Let me see, how old might you be? Twenty-seven, do you say? And you came away because of the love you bore her whom you believed to be your own sister? She still lives, so Jim writes, but her health is sadly suffering. How could you leave so good a home?

"But come, lads, cheer up. My tale has brought about a queer state of things. Bring on the ale, boys; let's drink to his health, and the little girl he left behind. The mail goes out in the morning; write to her and give her fresh life."

"That's so, Ned," said another, slapping him on the back; "I always thought you the luckiest fellow of the crowd. You think nothing of panning out a couple of ounces a day; and, now if old Dave's yarn be true, ye have a Countess for a mother, with a castle on the Rhine, and a fair-haired maid dying of love for ye! 'Taint no small luck you're born to."

The ale was brought, and though all drank to his health, never a drop passed Frank's lips. He had made a vow with himself never to taste it, since he had learned the danger of loving it too well, and sitting apart from the others while they sipped and passed away the time, he poured out his heart upon paper to those he had once resolved never again to see. He would be with them by Christmas time, he wrote. The letter was sealed and sent. Before it reached its destination old Dave had another letter from Jim. "Too late," sighed he, as he read on; "Madge died on Thanksgiving day." Frank never went home.

Correspondence.

LETTER FROM NEVADA COUNTY.

BY CARRIE F. YOUNG.

Ed. Agriculturist: The early rains have washed the dust from the foliage and the mist from eyes and brain. With the cool mornings ambition revives, and we remember our promise to the Agriculturist. This 13th day of November, in Nevada City, California, we plucked from the vines

RIPE STRAWBERRIES,

Large and luscious. Since October 1st *nine* pounds have been picked from the same vines. About fifty hills bore autumn fruit. The owners do not know the name nor where they originated. The fruit is dark-colored, long, and rich-flavored; the same plant bearing both long and short stems. They have been set three years; are cultivated by hand in hills. The soil is decomposed or rotten granite, very adhesive and compact; the yield of fruit so large it is not best to tell it. Red clover, sweet corn, apples, plums, peaches, pears, do full as well on this soil, but root crops cannot be as successfully grown. Water from springs is abundant all through the dryest seasons. We do not mean for a hundred, but for one, two, five or ten acres. The choice little homes are usually made on the remnants of old

WORKED OUT MINING CLAIMS.

Sometimes an acre of rocks can be covered with the "tailings" of a mill or a placer mine. The owner of the rocks hurriedly levels off as much as he can; then at the lowest end of his acre piles up brush and gravel, to confine the stream until the precious cement—clay, sand or small rock—can settle. After a few weeks the rocks are covered. In from one to two years the new soil is ready for spade or plow. The yield of vegetables, blackberries or clover is sometimes worth more in a single year then all the gold obtained by the original owners.

Some of these old-time miners, after their visions of gold vanished like the "baseless fabric" of dreams, have gathered enough cash to go home and return again with the girls they left in '49 or '52. These thrifty Yankee girls, by their economical habits and industry, are worth more financially than the best placer mine. The reason is obvious, is it not? The mine gave rich promise, but little gold. Years passed away. The promises were not fulfilled; the cabin was cold and cobwebby; bushels of sacks and torn garments accumulated; youth and vigorous early manhood were fading; old dreams and young hopes mocked and taunted the disappointed toilers. Very few, in comparison with the whole number who ought, have the courage to challenge the old sweethearts to share their poverty. We are acquainted in the mountains with several who did. The challenge was accepted. "Ah!" said the glad husband of six years, "poverty is nothing with such a wife as I have!" "Seek ye first the Kingdom of Heaven," we thought. After all they were not poor. The thrifty Yankee girl suggested clover and cows. The debris was caught, soil formed, clover sown, cows bought, good stalls provided, and

GILT-EDGED BUTTER

Is the product all the year, worth a

dollar a roll. Trees were planted, old ones grafted; tons of red apples command two cents a pound at the door. Poultry receives some attention, at remunerative prices. Strawberries bring twenty cents a pound at home. These and several other small (of themselves) resources make the money. The porches have vines; the windows that most beautiful drapery, growing plants. Fuchias and geraniums and heliotrope adorn the walks. A perfect wilderness of blossoming beauty and fragrance where once was only a dishwater mudhole!

Hundreds of worked-out mining claims are awaiting the dilligent hands of

HOME BUILDERS.

Even the crevices, where neither plow nor cultivator can go, will receive and perfect a peach tree or a grapevine. Peaches of a pound each are not unusual. The raisin grape yields bountifully. We have a cluster of Flame Tokay of three pounds weight. Bartlett pears, as fine as ever grew, by wagon-loads have rotted; not for lack of market, but of the co-operative industry to properly put into market.

Hoping all your readers may find blessed companionship, and thus be able to make happy homes, we send MERRY CHRISTMAS AND HAPPY NEW YEAR GREETINGS.

LETTER FROM KERN COUNTY.

THE FROST

Has caught us rather early this Fall, coming about the first of November, cutting down potatoes, squashes and corn which we expected would have two or three more weeks to perfect in, judging from last year's experience, as then crops of the kind kept growing until well into December. We have had .4 of an inch of rain, but do not depend upon rain for a crop. We shall plow and sow when ready,

DEPENDING UPON IRRIGATION

If it is needed. Some of our land produced fine crops of corn and potatoes this season from the seepage that came from irrigated farms above. There is a great change taking place on this island in this respect. Since new ditches have been made, on some of the farms where they had to dig twelve feet deep before coming to water, it now stands within three feet of the surface, and some think they will have to underdrain. Still there were many crops lost this season. The water supply was not reliable, because the ditches were new and unsettled. Such has been the trouble up about the middle of the island.

BIRDS, RATS AND RABBITS.

Down nearer the lake, where so much irrigation was not needed, the blackbirds on the corn and tule rats on the wheat crop discouraged some. Then another trouble that we all have felt is the rabbit pest. They not only destroy trees and vegetables, using up melons and pumpkins at a rapid rate, but barley and alfalfa falls in no small quantity before them. Their natural enemy, the Coyote, having passed away before the advance of civilization, the rabbits are left to increase and multiply and devour the products of the soil. But I think their day will soon be over, for

A MANIA FOR HOUNDS

Has spread among the farmers, and a half dozen of them on each section of land would soon "absorb" the rabbit supply, and, from what I have heard and seen, I have no doubt it will pay a farmer well to buy them at $5 each. Who can supply them at that price? How would it pay to raise them?

Showing the influence of

ELEVATION ON CLIMATE,

While fig trees all around on the flat lands were cut by frost, one tree planted on a sand ridge only five feet higher, stands untouched. And no ice has been there, though a thin scale has been formed on lower land on every side. As so many set out

LIVE POSTS

Late in the Spring, and fail to make them grow, I will take this opportunity to suggest if they will cut the posts in this month, even if they have to lay on the ground until Spring before they are planted, they will probably do better than such as are cut after the sap begins to start on warm days in February. Let any one try it, and I think they will plant their posts in the Fall instead of Spring after this. Adieu for the present.

Yours, ISAAC B. RUMFORD.

November 13th, 1876.

Educational.

The Smack in School.

BY WILLIAM PITT PALMER.

A district school, not far away,
'Mid Berkshire hills, one winter's day
Was humming with its wonted noise
With three-score mingled girls and boys;
Some few upon their task intent,
But more on furtive mischief bent;
The while the master's downward look
Was fastened on a copy book;
When suddenly, behind his back,
Rose sharp and clear a rousing smack!
As 'twere a battery of blues
Let off in one tremendous kiss!
"What's that?" the startled master cries;
"That, thir," a little imp replies,
"Wath William Willith, if you pleathe—
I saw him kith Thuthannah Peathe!"
With frowu to make a statue thrill,
The master thunders out, "Hither, Will!"
Like wretch o'ertaken in his track,
With stolen chattels on his back,
Will hung his head in fear and shame,
And to the awful presence came—
A great, green, bashful simpleton,
The butt of all good-natured fun—
With smile suppressed, and bitch upraised,
The threatner faltered—"I'm amazed
That you, my biggest pupil, should
Be guilty of an act so rude!
Before the whole set school to boot—
What evil genius put you to't?"
"'Twas him, indeed, sir," sobbed the lad,
"I didn't mean to be so bad—
But when Sussunah shook her curls,
And whispered I was fond of girls,
And dursn't kiss a baby's doll,
I couldn't stand it, sir, at all,
But up and kissed her on the spot!
I know—boo hoo—I ought to not,
But, somehow, from her looks—boo hoo—
I thought she kind o' wished me to?"

SELF-SUPPORTING EDUCATION.

ONE of our lady correspondents, calling our attention to the great amount of suffering among our young men and women out of employment, asks the following questions:

Is our educational system doing anything to enable our young people to grow into self-supporting citizens? Surely something beside Normal schools should be necessary to receive all our youths of both sexes who have a right to clamor for the privilege of becoming a successful artisan. The land is swarming with teachers, and we are still adding more to the supply. Let us have workshops and teach our boys trades, or make them familiar with the use of tools, so that upon leaving school, or during vacations, they can step into a shop and earn something toward their own support, thereby preventing much suffering. A MOTHER.

The above is full of importance to our educators, and especially to all of us who have children to educate. We are sure that every boy and girl should be learning some practical trade or branch of manual labor while attending school. Let the years of schooling be more, and include the skillful use of tools, and instruction by actual experience in some useful calling. Here are a few ideas which we quote from a report of one of the public school superintendents of Santa Clara County. It has the right ring to it:

"What we shall teach in our public schools seems to be a debatable question. The answer is plain. We should teach those branches actually necessary to fit our boys and girls for the vocations of life. That reading, writing, spelling, grammar, arithmetic, geography and history should be taught is conceded by all. As the importance of a thorough training in these studies and the best methods for accomplishing the same are to be presented to the Institute by competent instructors, I shall devote what few remarks I make to the consideration of other subjects that I consider equally important in a practical education. Our manufactories are becoming very important, and they demand trained help from industrial art schools. We must furnish it, or it will come from Europe and crowd our own illy prepared artisans to the wall. The competition that our mechanics are meeting is becoming more marked and decided every day. To meet their opponents successfully they must have a thorough technical training. The great conflict of the age is an industrial conflict. The time is past when armies will decide the superiority of nations. We must look for some other arbiter, and we find it in the industrial arts. The great contest of future ages will be fought and won at International Expositions. The different nations of the earth are preparing for the contest. Reports show that there is but one opinion on the subject of the necessity of an industrial training. All Europe has begun to move in the matter. Even now we are far behind in this particular, and it behooves us to act, and that quickly, too, in our own defense. The reasons for such an education are many and important. Our present system does not meet the wants of the times. The proof of this statement is the large number of young men and women that are growing up among us without any aim in life. This condition of affairs arises from many parents being prevented by their silly pride from giving their children any industrial training whatever, and from there being no means provided for a technical education even when desired. If our children are failures in life we have no one to blame but ourselves. Their education unfits them for any calling; hence they follow none. Children must be taught to work. Labor is their only salvation! The boy who becomes a merchant, a mechanic or a farmer, fills just as honorable a position in life as he who turns his attention to medicine, to law, to letters, or to theology. All labor is equally honorable! And the sooner we realize this fact in the education of our children the fewer tears will we have to shed over their failures and disgraces. The question, "what shall we do with our boys?" need not trouble the public mind. If we give them the proper education they will take care of themselves."

Keeping Boys on the Farm.

Among the many questions for parents to ponder now are: How shall we train our children? What vocation shall they be educated to follow? What is best for them and us, and society generally? Some of the people leave their children floating, ready to take any direction chance may happen to give. It is certainly a very important matter to consider these questions, so as to act exactly right from a realizing sense of responsibility, and with an enlightened forecast. In regard to one of the many avocations, in a late discussion an intelligent farmer gave his views as to the importance of improving the estimate and outlook of farming, so as to make it more attractive and interesting to boys and young men; and we think there is much weight in what he says:

"I consider this the most interesting subject that can be discussed; interesting to us as individuals, and interesting to us as a community. The society of our town depends upon the action of our young men—whether they are taught to love the farm. From whence has come the stability of our whole country? From the young men who are raised in the country. How are we to interest the boys? How are they to be held upon the farm? One step in that direction is for the farmer to honor and have a greater respect himself for the business in which he is engaged. Every one believes his business is the worst, and it is seldom that children follow the business of their parents because they hear it spoken so disparagingly of. So, if the farmer is talking of poverty, etc., will the boy be likely to follow the farm? No; then speak respectfully of the occupation and teach the boy to honor it. The position that farming occupies in relation to other professions with regard to making money, prevents young men from desiring to follow farming. They look upon the city clerks and see them well dressed and apparently in the enjoyment of ease, and when they contrast this with the patched, soiled clothes which they are obliged to wear, perfumed as they are from the cow stable, with a scarcity of spending money, notwithstanding hard labor, it renders them discontented and encourages desires to flee from the farm to more congenial pursuits. There is one advantage in farming, that in that occupation the man is comparatively independent. Seed time, harvest and the increase follow each other in due course, and the uncertainties of trade and liabilities of loss do not disturb his slumbers, and so long as the soil is productive, he is sure of his daily bread. Boys should not be overworked, for in that they get the impression that farming is a sort of perpetual slavery."

Says Dr. J. G. Holland:

"If the American farmer wishes to keep his children near him, he must learn the difference between living and getting a living; and we mistake him and his grade of culture altogether if he does not stop over this statement and wonder what we mean by it. To get a living, to make money, to become 'fore-handed'—this is the whole of life to agricultural multitudes, discouraging in their number to contemplate. To them there is no difference between living and getting a living. Their whole lives consist in getting a living; and when their families come back to them from their schooling, and find that really this is the only pursuit that has any recognition under the paternal roof, they must go away. The boys push to the centres or the cities, and the girls follow them if they can. A young man or a young woman, raised to where either can apprehend the difference between living and getting a living, can never be satisfied with the latter alone. Either the farmer's children must be kept ignorant, or provision must

be made for their social wants. Brains and heart need food and clothing as well as bodies; and those who have learned to recognize brains and hearts as the best and most important part of their personal possessions, will go where they can find the ministry they need."

Brain Farming.

The time is coming when the elementary principles of agriculture will be taught in our public schools. The time is coming when the sons of our farmers, who are sent to institutions of learning to obtain a respectable education, will pay less attention to learning the Greek and Latin languages, and the higher mathematics, and more attention to studying such authors as Liebig, Johnson, Silliman, Agassiz, &c. The learned professions are all filled to overflowing. Half of the members cannot make a living. What is now wanted is, education to fit men for farming—to make the profession of farming as honorable, as reputable, as any other. If the members of the agricultural profession are as well educated and as well qualified, there is no reason why they should not fill important positions—which are now almost completely absorbed by the learned professions, as they are termed. It is true there is not much progress in this direction, but there is some. Let there be more. Let farmers be as well educated for their profession as other members are for their special professions. Farming will then become more profitable. Brain farming is increasing yearly. By and bye we hope there will be no other, and that it will be educated brain at that.—*Ex.*

Educated Farmers.

Just in proportion to the successful cultivation of the soil, is the aggregate prosperity of the human family augmented. As agriculture is the foundation of all success in every department of business, how important then that it should be studied and understood by those engaged therein! It was the first vocation to which man was called by the voice of his Maker, to till the soil, and it is yet the highest and noblest profession on earth among men. It is not only above all others, but it underlies and sustains all others, and all others acknowledge their dependence upon it.

Brains and muscle should share equally all laborious occupations. But the brain should direct the muscle and utilize and economize its power.

Culture of Sugar Cane.

A writer in the Florida *Agriculturist* estimates the cost of seed for an acre of sugar cane at $15. The machinery for manufacturing on a moderate scale will cost probably about $200, but the industrious poor man can plant a smaller area until he raises his own seed, and the income from his first acre manufactured and sold will pay for all necessary machinery. A market is always at hand, and an article as staple as sugar or syrup can never fail to be in demand at remunerative prices. At the present time more than the ordinary inducements are offered for engaging in this business. Cuba, which has furnished no small portion of the sugar consumed in America, is now so demoralized by domestic troubles, that for some years at least she will be wholly unable to furnish the usual quantity, and the market value must necessarily be increased. To raise an acre of corn in the State of Illinois requires a greater annual expenditure of capital and labor than to raise an acre of cane in Florida. It has to be planted every spring, and cultivated throughout the greater part of the summer, while cane, once planted, grows for years, and needs but little cultivation after the first season. A successful crop of corn gives a yield of about 40 bushels per acre, and an average home price of 50 cents per bushel is usually quite satisfactory to the producer. If, therefore, the Illinois farmer can become rich raising corn at $20 per acre, why cannot the cane grower in Florida progress much more rapidly, when his crop requires no greater average expense, and yields from $200 to $300, instead of $20 per acre?

There are portions of California where sugar cane might be produced, we believe, at a profit. We would like to see such of our farmers as can well do so, try the experiment on a small scale, at least, for the sake of knowing how it will grow on their farms.

Stock Breeder.

Suggestions About Breeding.

A PERFECT development and sound, vigorous health, constitutionally, especially in the generative organs, are conditions of fertility.

2. In the maintenance and improvement of breed, the truth that "like produces like," that the reproductive germ will stamp upon the animal developed from it the characters of the parent organism, is the backbone of success.

3. We can, in a great degree, at will, produce variations and improvements in breeds, as by abundant feeding, a mild and salubrious climate, a rich and healthy soil, moderate use, education, stimulation, or selection of desirable qualities; by disease or rejection of undesirable characters and properties; by soliciting the weight of imagination in our favor; by allowing the breeding animals to mix only with those of the stamp desired; by crossing less improved breeds systematically with mates of a better race, and by crossing animals faulty or deficient in some particular point with others in which this point is developed in excess.

4. The herding of pregnant high class animals with low bred ones, and the resulting attachment between the two races are to be especially avoided, as occasionally affecting the progeny injuriously; strong impressions from a new or unusual condition of surrounding objects are to be equally guarded against.

5. If a valuable female is allowed to breed to an inferior male, she cannot be relied upon to produce pure bred animals for several succeeding pregnancies. Through a strong and retained impression, the absorption into the system of living particles (germinal matter) from the fœtus, or through some influence during pregnancy on the ova, then being most actively developed, the good or bad features of the first sire are perpetuated in the progeny of succeeding ones.

6. All breeds show a tendency to "breed back," or to produce offspring bearing the marks of their less improved and comparatively valueless ancestors; hence, individuals of this kind must be rejected from the best breeds if we would maintain their excellence.

7. Certain races and individuals have their characters more fixed, and will transmit and perpetuate them in greater proportion than others with which they may be crossed. If their qualities are desirable, they prove highly valuable in raising stock of greater excellence.

If undesirable they will depreciate the value of any stock crossed for many generations. That fixity of type, however, is, above all, a characteristic of those which have been carefully selected and bred up to a certain standard for many generations, so that in our best, longest established and most esteemed breeds we have a most valuable legacy left us by the successful breeders of the past with which we may mould our inferior races almost at will.

8. While breeding continuously from the nearest relations tends to a weakened constitution, and the aggravation of any taint in the blood to sterility, these may be avoided by infusing at intervals fresh blood of the same family which has been bred apart from this branch of it for several generations. Moreover, the highest excellence is sometimes attained only by breeding very close for a time.

9. Diseased or mutilated animals are generally to be discarded from breeding. Mutilations resulting from disease existing during pregnancy, and disease with a constitutional morbid taint are above all to be dreaded as transmissible. —Prof. James Law, in *New York Herald.*

Household Reading.

AN EARLY MORNING SOLILOQUY

Mrs. S. Talks and Thinks to Herself.

BY MRS. LIZZIE WRIGHT.

"This is very much like savage life," Mrs. S—— said to herself between two puffs at the obstinate fire; "when will I learn to look out for myself. It is just as mother used to tell me, exactly." Mrs. S—— was thinking now, fussing with the fire meanwhile, putting the half burnt slivers together, and herding up the dim coals, but it would not burn, so she took up an old pan and run out into the shed, half dressed as she was, to pick up chips. The shed was open, and the winter wind made her shiver.

It is strange how much one can think over in a brief space. She saw while hastily scratching up the chips, a picture of herself away back in the old home, making the fire one cold morning, while her mother's voice from the curtained bed at the other end of the room was saying, "why don't you lie abed till some of the men folks make the fire. I see this is the way you will always do." Then she had answered in perfect trust, "no, indeed, if ever I'm married, and have a house of my own, the morning fires will go unmade all day if they wait for me to make them." "How is it now," she went on talking and thinking to herself while putting her chips on the fire, "there are two fires to make this morning, and I, alas! am making them both, while he is in bed. Why haven't I common sense enough to know that men will take what ease they can get. Oh, why am I not wiser. I am not fit to do such rough work, and yet I keep on doing it because nobody else will do it for me. I have about come to the conclusion that I shall be allowed to do it as long as I can. These are hard thoughts, but I can't help them. I shall keep them to myself, certainly I should be extremely mortified to have those things known. I can only tell it all over to myself to free my mind. If wives did not come so easily," she soliloquized, "these farming men would be more careful of those they have. I wish I could legislate on this subject for them. 'Oh,' they say, exultingly, "'tis hard, surely, to find a hired girl, but if you say *wife*, a dozen women are ready to bind themselves unconditionally.' Oh, I can't help confessing to myself, with bitterness, that there is truth in what my mother used to tell me. 'If you work yourself to death you will never get "thank you" for it.' I feel just now like laying this down as an axiom: 'the harder a wife works the less he husband loves her.'"

"And why should he not love her less? To be sure it may be to save expense, and to make himself and children more comfortable, that she overtaxes and burdens herself. She may rise early on Monday morning, make fires, get breakfast, and have her wash water over before her husband is ready to get up—do it all under silent protest, too, because it must be done and it is so much better to have it all done early and out of the way, for the comfort of the family, and to give time for the sewing and knitting. But in making fires she blackens and burns her hands, may be, and in washing the skin is rubbed off and the joints spread. They are all soaked up and reddened, and after a period of excessive hard work they cease to be pretty, and her husband knows it. She may dress herself neatly when her task is done, and have on her face that pleasant look which the consciousness of a hard job completed tends to give; but she is tired, worn, and jaded; she cannot be bright, joyous, and vivacious; and, unless she has an uncommon amount of spirit and independence, a few years of this round of work drags her down, until her husband is *thought* comes to regard her as *'the old woman.'*"

"There are so many things she can do to save expense; house-cleaning and papering, and even whitewashing, and blacking the stoves, and all the sewing, *of course*, that she can hardly bring the week's work within the week; seldom finding time for those artistic arrangements of dress and hair which all admire, whatever they may say; and husband, unconsciously perhaps, draws contrast between her and the lively, sprightly beings he meets here and there, who are not worn down with work and care, because they have mothers to look out for them, while, alas, in too many cases, the wife of the farmer has no one to aid or council her."

"It vexes one to hear women, as a class, talked to as though they did nothing. Does a woman who rears a family of children do nothing? This wide country is covered with farmer's homes. Some of the wives are strong and hearty, able to walk under their burdens; nevertheless it would be fearful to count up the farmer's wives who are literally *worked to death!* Some, who have no ambition beyond the round of housework, may live, and thrive; but the finely organized woman, who has delicate taste and inherent strivings after better things, must look to herself or she will wear rapidly away under the farming regime. Why is this so with farming more than with other business?"

"But the saddest is the matter-of-course way in which the husband views it all. It is a matter of course that his wife should do all she can; that she should be constantly at work, never finding time for recreation. A matter of course that she should grow weaker and weaker, less and less efficient, and should finally leave him free again. It is not often that the husband of the woman who has worked herself to death is guilty of repining long for her loss. The

great march of events must go right on the same as ever, as though nothing had happened, and a fresh helpmeet is soon installed. The poor children! Oh, well, to be sure, in all the wide world they can have but one mother!"

"But now to this day's work—I must hurry to get it done before I am too tired." The fire was burning nicely now. Mrs. S— had been thinking and talking, while warming her fingers and lacing her shoes, so there had been no time lost. Her journal of to-night will show whether she finished her day's work without getting too tired.

SATURDAY EVENING REVERY---NO. 3.

BY M. E. T.

Close application and late hours enabled me to finish my new suit—ruffles, bands, buttons and bows, all complete, and in due time for the contemplated visit. And now, before attempting to gather up the tangled threads of discourse, permit me to say that I have had a very pleasant visit indeed. I spent a night at the hospitable home of our Editor and his amiable wife, Mrs. H., a lady of high mental culture. In her I have had the rare pleasure of seeing a woman who possesses the moral courage to practice after the counsels of her better judgment. We had quite a *tete-a-tete*, from which I drew both pleasure and profit. Among congenial natures there is a soul-stirring element that lifts us to a higher plane of existence. We rise for a time, as it were, above the quagmire of pretense and folly, and reach out, longing to plant our feet more firmly. But the elements conflict. Temptation, like some tempest tossed wave, overtakes us, and we fall again into foolish frivolities. Nobody pities us—at least very few. This lack of sympathy is the very subject I meant to ponder in my evening's revery, as one of the unpleasant consequences arising from our improper mode of living.

Did you never think how little love and sympathy we get as a class? The wealthy condemn and despise us for attempting to compete with them; while those below us on the ladder of life entertain opinions, as many as there are rounds. Some are jealous, some are envious, and some bemean us; but nobody pities us. Surely, poverty and respectability combined make for us the roughest road of all in the great human ladder.

[Against the *better judgment* and request of Mrs. H., the editor allows the above deserved compliment to his wife from friend M. E. T. to appear. And we will here take occasion to put in a word as to M. E. T.'s sentiments about poverty and respectability. While we sympathize with and pity, we cannot participate in the sentiment. We claim to know what poverty means, and to be respectable, but positively have no desire for the society of persons who allow their wealth to become a bar between us. To gain wealth for the privilege of such society, is happily no part of our ambition. It seems to us that it must lower any person in his own estimation to even care for such.

There is a plane on which congenial spirits can meet—the plane of honest frankness. The artificial life framed in accord with conventional customs of aristocratic pride, is in conflict with Americanized social ideas, and contrary to ennobling feelings and to common sense.

Money surely gives great power. It can build palaces and command armies. But the man who is respectable and rich might be as respectable and poor. In manly and womanly independence, moral principles, intelligence, determined character, the love of justice and of doing good, together with all the traits that add grace, kindness and affectionate sympathy to the soul, there is much to respect and to love. The rich do not monopolize these virtues. The "poor and respectable" may possess them and other desirable qualities in a high degree. The wealthy mostly covet their possessions of money, and depend rather upon the homage paid their wealth, and with these rest satisfied.

True and perfect friendship depends not upon wealth, pretense nor pride. It it is unostentatious and unassuming. It lives not upon dress-trimmings nor outward show. By the law of congeniality it springs from the hearts desires, and grows through mutual, reciprocated, upreaching thoughts, feelings sentiments, souls.

One real friend is worth a world of riches;—a million worlds of hollow hearts. A few choice friends, and such as care for each other's society, for the mutual benefits and enjoyments, are enough. The whole human family is as much ours as anybody's, but it is only such as choose us and such as we choose that we care for as special friends, companions or associates.

It is worth being "poor and respectable" to know our real friends. Poverty may be an inconvenience, narrowing our powers, comforts and enjoyments oppressively. But after all it is a trifling evil, born of man's selfishness and greed, and borne by others as deserving as any of us. Let us see that our pride makes us not envious, and that our desires are in harmony with the better promptings of our natures.—ED. AGRICULTURIST.

HOME MUSINGS.

Greeting from the Redwoods.

BY M. E. O. W.

Every month that the AGRICULTURIST has been laid on the study table, in its tasty, neat dress, we've wanted to write and say how very much we thought of it. But cares and sickness have prevented. Why could we not have been made so as to go "all at once, and nothing first," as the Deacon's "One Hoss Shay" did.

It's such jolly fun to go here and there and everywhere, do lots of work, have much done, a clean house, yard and garden. It's such a comfort that everything unsightly has been removed, and we can sit down contented. The *paying up for the overdoing* is the part we don't like.

Here it is November, with its frosty nights and sunny days. The bright leaves on the forest trees and vines speak of the near Winter—such beautiful Winters as California has! If humanity would only look for and accept the lovely *little things*, as they come along to make our lives noble and good, what a world of perfect pleasure this Earth would be.

This morning the old adage came up, that 'twas "better *late* than never." The study looked so inviting, with its fresh flowers and cheerful wood fire,—who wouldn't write?

How many times have we thought of the little mother, "propped up with pillows," and "the dear baby face" nestled so close to the warm loving heart. We have pictured the sweet home, away off somewhere—where we shall never find it, only in the AGRICULTURIST — of two strong, faithful hearts, giving glad welcome to the little stranger. The pleasant castles we have built for the wee nestling, (in mercy may they never tumble about his ears,) of when he shall have grown for twenty-one bright Summers—does not chew or smoke tobacco, nor drink any of the vile compounds made for humanity's ruin, and can express in gentle language all pure thoughts, with no room in the noble mind for any other; can think that a woman is as good as a man, therefore should be equal, and love the little mother so tenderly true. Will it not bring balm for that "aching body," and a happiness into that "every-day sameness of life," to which we are *all* more or less bound by circumstances?

It seems to me that no gift can equal the boon of motherhood, if one can only keep the treasures loaned, even but for a little time. It is better than to count eight grass-grown graves, and know that the little footsteps will never, *never* gather round the cheerful fireside. To know that ones hair is getting thin and gray—that one's eyes are getting blinded. Soon there will be no more glad songs filling the home with their echoes; no willing, busy feet, waiting willingly our every call; no sweet voice calling, "Mama, see here," and "Mama, see there," as the pleasant things of home life come and go. Shall we then sit down and in weariness wait? No. The wounded, bleeding mother heart must shut away its pain, work cheerfully on until the harvest is finished and the gleaners called home.

We cannot *quit* without asking the usual number of questions, and sometimes they don't get answered, too! Is it really cheating to make everybody believe that we're the happiest woman alive? To fill our home with books, music, flowers and song? To make it a place of glad welcome to all who enter its blessed portals? Though sometimes chidings must be given, if a mind is found to be uncultivated, or pernicious habits are being formed. It must not be cheating to make others happy, though one's own heart is bursting with cruel disappointment, and it certainly brings a comfort that brooding never could.

The next question is

ABOUT MY ROSES.

For two years they have been visited with two fearful plagues. The first and worst are little beetles, with gauzy wings folded under their brick-red backs, with which they fly; the head, legs and *bill* are jet black. The beetles bore into the buds, and they wither and fall off. We have tried many things, but nothing works satisfactorily except the hands and very carefully, too, for at the least noise the beetles turn over on their backs and slide off, and they are not to be found, even by diligent search. The other trouble is something like fungus, that draws up the leaves, blasts the buds, and though the plant lives, it is no longer a "thing of beauty." We like roses so very much, and have had to work so hard for them, that we cannot willingly give them up without at least one more effort to save them. We have three varieties of

FLEUR DE LIS,

Blue, purple, and buff. This year, for the first time, they have been infested with a long black beetle that ate buds and flowers alike. The beetles looked very much like what the children called snapping bugs, in the days when we were young. Big or little bugs are disagreeable, at least in one's flowers. Is there not some way to get rid of them?

Are

ASPARAGUS PLANTS

Advertised for sale in California? We have looked long and carefully and found none. We dug a large bed, trenching two and a half feet deep, filling in with well made compost, and lots of salt, according to Burr's work on "Field and Garden Vegetables," and sent East for plants. They came all right, and were nice looking. They were planted, but only a few came up. We would like to know where we could get a few of "Conover's Colossal" plants to fill out the bed with. Of all nice things in a kitchen garden, asparagus is the crowning glory. It takes a good while to get it started, but when once done it comes so early, does not mind the cold weather, and grows so much food on a little piece of ground. It is good in every way it can be cooked—never tried it raw—but our favorite dish is to cut the shoots or tender part into little pieces, and boil until thoroughly cooked, then thicken with a little flour, season with salt, butter and pepper, and turn on nicely browned toast. "It is good."

GRANDFATHER'S LETTERS---NO. 10.

Events of the Last Century.

INGLEWOOD'S LAST LETTER BEFORE MARRIAGE.

To Aunt Mary, Ma, and Angie:—Now that you have opened a correspondence, and coincide with me in thinking it better, in some cases, to give expression to our sentiments by writing than *viva voce*, I have the assurance this will be kindly received. From our interviews I have heard that the trio, Aunt Mary, dear Ma, and the darling Angie, are all in favor of matrimony, provided it be well and suitably accomplished; exactly the sentiments of Inglewood. So pray allow his name to be added to the list, and may it ever be a happy quartette. Angie's objections I do not consider at. Thank Ma for coming to my assistance. She knew how time passes, what a long period five years seems while yet in our teens, what a short when we get into the busy, active scenes of middle life. Though no advocate for the disparity of ages, how often in our passags through life does our choice lie between two evils; or, rather, between two things, neither so good as might be wished. Were it in my power to bring to Angie what I now have to offer, and in addition, years only equal to or a little over her own, how gladly would I do it. But as my age is twice hers that is impossible, and I must look, and ask the darling Angie to look with me, over the case as it is. The advantages of this seniority are in having this home and homestead, with its appurtennces, free of debt, which I could not have had at an earlier period. It has cost years of toil and self denial. You, dearest Angie, have had opportunities of knowing the habits I have formed: now established by the growth of years; exempt from the danger of relapsing into evil ones. Another advantage is the longer experience and greater observation I can bring to our mutual advantage than could have been done at an earlier period. In the compauionship I am seeking, you know it is not only a wife in the ordinary acceptation of that term, but for a helpmeet for all the deyartments of our nature; the physical and intellectual, the moral and spiritual. The last two, I shall be ever ready to think the supremacy rests with the feminine. The two former, with the masculine. But all there must be mutual counsel, confidence, advice and prayer. Then with the love principle ever kept aglow, you will find Inglewood more thoughtful of the welfare and happiness of the darling Angie than of his own. Such, dear Ma and Angie, are some more of the sentiments of your old and true lover,

INGLEWOOD.

Boys and Girls.

What Little Tot Does.

Monday I take my little tub,
And fill with soap and water;
And my dollies' clothes I rub, rub, rub,
Ma calls me her good daughter.

Tuesday I heat my tiny iron,
And smooth my dollies' dresses;
Dress them up nicely in clean clothes,
And comb their silken tresses.

On Wednesday mamma cuts some work
And I sew it neat and tidy,
And mamma comes and kisses me
And says I'm a little lady.

Thursday I to the kitchen go,
Help mamma do the baking;
And bread or cakes, or pies or tarts,
I make what she is making.

Friday I give my dolls a feast,
Then take them all out walking;
You'd laugh to hear the funny things
They say when they are talking.

Saturday we have a merry time,
Some game or merry frolic,
Unless a dolly is taken sick
With toothache or the colic.

Sunday I read some little book
Until the bells are ringing,
With mamma go to church and hear
The sermon and the singing.
—[Rural New-Yorker.

The Caged Mouse.

I'm only a poor little mouse, ma'am!
I live in the wall of your house, ma'am!
With a fragment of cheese, and a very few peas,
I was having a little carouse, ma'am!

No mischief at all I intend, ma'am!
I hope you will act as my friend, ma'am!
If my life you should take, many hearts it would break,
And the trouble would be without end, ma'am!

My wife lives in there in the crack, ma'am!
She's waiting for me to come back, ma'am!
She hoped I might find a bit of a rind,
For the children their dinner do lack, ma'am!

'Tis hard living their in the wall, ma'am!
For plaster and mortar will pall, ma'am!
On the minds of the young, and when especially hungry,
By, upon their poor father they'll fall, ma'am!

I never was given to strife, ma'am!
(Don't look at that terrible knife, ma'am!)
The noise overheard that disturbs you in bed,
'Tis the rats, I will venture my life, ma'am!

In your eyes I see mercy, I'm sure ma'am!
Oh, there's no need to open the door, ma'am!
I'll slip through the crack, and I'll never come back,
Oh, I'll NEVER come back any more, ma'am!
—[Laura E. Richards, St. Nicholas.

OUR CORNER.

HERE WE ARE, with Our Corner stuffed full of letters and contributions. There is so much that Aunt Polly wants to say, that she hardly knows what to write.

At this holiday season of the year, everybodies' hearts are full of good feelings. Some are thinking what to do to make others happy, while others are planning and guessing what they can have to be happy themselves. Of course those who try to make others happy will themselves be happiest, because they doubly enjoy. Those who think only of self generally have a very mean self to satisfy, and are likely to be cross and dissatisfied, no matter who makes them presents.

But all the readers of "Our Corner" are going to do something to surprise somebody, something to make somebody happy!

Perhaps we may be too poor to make rich presents, the most of us, but we can all be able to give some trifle, the work of our own hands, if ever so simple, that will be equally as acceptable as the offerings of the rich, because coming from our hearts as well as our hands. We can all do some little acts of kindness to show our regard for those we love and for those who need and can appreciate our regards.

Aunt Polly cannot take you all by the hand, really, but as your eyes glance at these pages you can imagine how she would like to do so, and how she will think of you all, hoping you will be as good and happy as you can be.

A MERRY CHRISTMAS

From Aunt Polly. The new year will soon be here. Now let every one of our circle write something to "Our Corner," that we may have a Happy New Year altogether!

Of course you all enjoyed Thanksgiving. Aunt Polly did, and so did the little ones around her. Read Nell Van's Thanksgiving story. It really belonged to our corner, but the naughty editor put it in another part of the paper. But its just as good for all that.

And now for our bushel of letters. In the first place, here is what Lulu says about

LINDA AND HER PETS.

"I promised to tell you more about our little girl and her pets, when I wrote abont her 'Orphan Asylum.' First, I will tell you what happened to the chick. One night Linda had tucked him up warm in his chip bed, for the night, when her big sister (not knowing him to be there) set a heavy basin of water on the poor little chick, and, after a short sickness his eventful life was over. Next day there was a grand funeral. All the relations and friends were invited to attend the ceremonies, after which he was laid in his last bed under the lilac bush. There he will enrich the ground, and bloom out in great purple clusters of flowers, or make beautiful green leaves.

Linda has a new pet now, that engages her whole attention. It is a young dog which she calls "Queen." She is very playful, and follows her mistress all around, like the little 'dorg' Johnnie had. Did you ever hear about him? I will tell you one verse:

Johnnie had a little 'derg,'
His hair was black as jet,
And everywhere that Johnnie went,
That 'purp' went too, you bet!

A little white-headed boy used to like to recite that when I went to school in your town, Aunt Polly. Linda's dog likes to go with her to the spring for water, but she has to watch him or he puts his nose in the bucket, and then she has to go all the way back for more! He has one bad habit. He will chase the chickens, but we hope to break him of that soon. It is amusing to hear Linda try to scold him. She says (trying to be cross): 'Have you been after chickens, you naughty dog?' Then, in another minute, she calls, 'Here, Queen!' and off they go, bound for a race through the clover fields. Sometime, I will write you something more. Perhaps—oh well, you'll find out when the time comes!" LULU.

MILPITAS, Oct. 29, 1867.

DEAR AUNT POLLY:—In my last letter I sent you any answers I could guess to the puzzles. I do hope no one will guess my two puzzles, as I am very anxious to get the premium. I do not know which of the puzzles to call best; they so fairly puzzled me that I was more than satisfied with them. Is there any particular age over which we cannot get your premiums. I am fourteen. I hope I am not too old, for I certainly am very small. Your Neice, TILLIE.

ABOUT THE PUZZLES AND CHROMOS.

Aunt Polly requests her nephews and neices who have sent puzzles which have not been answered, to write and say in which number of the paper they appeared, and also to say which of the four chromos, "Romeo and Juliet," "Waiting at the Well," "The Birds," or "The Chick," they desire to have as premiums for puzzles not answered. She has so many cares upon her just now that she can hardly keep track of them all. Also if any one entitled to a chromo has not received it, please write at once, and it shall be attended to.

CANDY FOR CHRISTMAS AND NEW YEARS.

DEAR AUNT POLLY:—I was sorry to hear that there was sickness in your family, and equally so to miss the good letters from our bright circle of children, that is widening each month, showing that they are gaining interest in "Our Corner." That 's right, keep on writing, and do please tell us what Santa Claus gives each one of you. That would be a splendid entertainment, to hear how each child spent Christmas. And right here, remember that each of you must make one other child happy in some way, if you would truly enjoy your own presents and blessings. Your old toys would be new to other children, and very acceptable, if they are poor, and have nothing better given them. But I want to tell you about a good lady I know, who lives near me on Ninth street, next to the Quaker church, who is making the nicest, sweetest, purest candy you ever tasted of; it is made of pure sugar, colored and flavored with perfectly harmless articles. She has Centennial rock; fruit cream, that melts in your mouth; chocolate cream; chewing candy—and such a variety—that you will want some of all kinds. Only forty cents for a whole pound! Santa Claus should be sure to fill his bags, as it contains nothing harmful to make children sick. Remember the place, Ninth street between St. James and St. John, next to the Quaker meeting house. Mrs. G. G. Chase is the lady's name Yours,
JEWELL.

AN UNREASONABLY SMART BOY.

NATIVIDAD, Oct. 18, 1876.

DEAR AUNT POLLY:—I see that you have published the little piece that Joseph Riordan sent up, so I will send you a few lines, as it is recess now.

Natividad aint a very large town, but it contains a very smart boy, who, without looking at any book can tell you all about it, and what's in it also. His name, Charley Bates, A. M. He is very unreasonable smart. He is now studying on examination for the next teachers' examination in Salinas City. By the way he is only 13 years old. How is that for Natividad? Some people think the reason he is so smart is that he has never had his hair cut since he was born. It almost touches his heels. Yours, &c.,
HARRY & GEORGE.

A FIRST LETTER.

RIO VISTA, Sept. 28, 1876.

DEAR AUNT POLLY:—This is the first time that I have written to you. I am only ten years old, so you cannot expect great things of me. I have been to school six months this Summer, and studied, reading writing, grammar, geography, arithmetic and sentence-building. I have commenced to make out some of the puzzles in the AGRICULTURIST, and think they are very interesting. Here is a puzzle that I assisted in composing:

I am composed of 23 letters.

My 4, 10, 13, 18, 8, 6, is a kind of melon.

My 6, 3, 16, 23, 11, 23, is a Western State.

My 21, 5, 16, 12, 7, 4, 5, 13, 22, 12, is an American peninsula.

My 17, 21, 13, 14, 19, 3, 18, is a whole number.

My 9, 8, 15, 20, is a famous bridge.

My 19, 12, 1, 2, was the home of Goliah.

My whole is rich in silver.
FANNY BARKWAY.

ANOTHER FIRST LETTER.

HILL'S FERRY, Oct. 9, 1876.

DEAR AUNT POLLY:—Here is a puzzle I send to the AGRICULTURIST, if you think it worth publishing. I am twelve years old, and it is my very first attempt at such a thing. I don't know whether it is correct or not, as I had no help in composing it. If you think this is worth putting in your paper, I will try and do better next time.

I remain as ever your little neice.
FANNIE B.

THE PUZZLE.

My first is in bird but not in bee.
My second is in flower but not in tree.
My third is in weak but not in strong.
My fourth is in blade, but not in prong.
My fifth is in bad but not in good.
My whole is in some kind of food.

AND ANOTHER ONE.

SARATOGA, Nov. 12, 1876.

DEAR AUNT POLLY:—I am a little girl eleven years old. I live in the mountains near Saratoga, and uncle takes the AGRICULTURIST. I often read the letters in "Our Corner," and thought I would write a letter to Aunt Polly, and hope it will be well received. I am learning to ride on horseback, which is very necessary for us who live in the mountains, for in Winter the roads are so bad we cannot go in any other manner. We have just received the AGRICULTURIST. I am sorry there was no "Corner," and that Aunt Polly had sickness in the family. This is my first attempt to write for a paper. Will try to do better next time. MAUD C.

AND STILL ANOTHER.

SALINAS VALLEY, Monterey Co., Cal., September, 1876.

DEAR AUNT POLLY:—I live in Salinas Valley, near Salinas City. I have three sisters and one brother. Mama takes the AGRICULTURIST. Good by.
ANNIE WILLIAMS.

P. S.—I forgot to tell you how old I am. I am ten years old.

Here is a letter, a puzzle and some poetry, from a neice who promises to be a poet one of these days. Aunt Polly thinks she is real smart for one so young:

DEAR AUNT POLLY:—I thought I would write you a small letter. I am 10 years old. My father takes the AGRICULTURIST, and I like it very much. I could not make out the puzzles, or I would have written before. I will send you a small puzzle and some pieces of poetry that I have made all myself. If it is not too much work will not you please correct the mistakes in my work. I wish to join the consins in Our Corner, and be your neice. Here is my

PUZZLE.

Y. R. X. St. Ream
L. Y. 876
543
1419

MY LITTLE SISTER.

I have a pretty little sister
With eyes of a very bright blue,
The color of her hair is auburn,
And her cheeks of a delicate hue.

Now is it not a great pity
We can find her no pretty name?

The names were all so pretty
Before little sister came.

My sister's a little darling,
She is so sweet and good,
And she looks so very cunning
When she has on her little hood.

For anything in this world
I'd not part with little sister;
One day she was away,
And oh! how much I missed her.

After much hunting, we have found a name. It is ROSE, the queen of the Posie. We are all happy when sister is near.

LITTLE BABIES.

Little babes are the pride of the households,
Always laughing sway care:
See their eyes are bright as sunshine,
And their little face so fair.

Every one should have a birdling,
To creep or trip about the floor,
And every morning see a bright face
Peeping at the chamber door.

Dear Aunt Polly, I suppose this will fill up Our Corner, so I guess this will be enough for this time.

Your Neice,
YETTA FELDMAN,
San Jose.

Aunt Polly has some more poetry of Yetta's, but will save it for another time.

Here is a square puzzle, for curious ones to find out:

WOOD
JOHN
MASS.

It is said that this letter found its way through the mails to its proper destination and owner.

Hygienic.

HOW I DRESS MY BABY.

BY "JEWELL"

IN the first place, warmth being the life of young infants, I keep one or two coverings of flannel over the entire surface of the body, excepting, of course, head and hands. The shirt I make high necked, long sleeved, and long enough to cover the bowels, to the thighs, opened down the front, and buttoned, which I find most convenient to put on and take off. A flannel waist with buttons around the lower part, on which I fasten a flannel and white skirt, over which is a white slip, long sleeved and high necked. The stockings I have of white woolen, which reach up to the diaper, above the knee, and if I cannot buy such I make them out of old stocking legs. Over these I have white cotton ones, which I fasten to narrow elastic straps at the side, which in turn fasten to the waist by a loop, the buttons being on the elastic. When baby was in long clothes I omitted the white stockings and shoes.

In this way the child is kept warm, the clothing equally distributed over the body, and perfectly comfortable, and the whole body is loosely yet warmly dressed; four very essential points towards the health of children. Also, the simple way of making and putting on and off greatly helps us overworked mothers.

At night I put on two flannel nightdresses, one not being warm enough—nothing else, but the diaper, which, by the way, I have of heavy flannel for the night, as it keeps warm when wet, and is not so disagreeable to the child to sleep in.

This idea of toughening our children by half dressing, I don't believe in. The very people who talk it are either hot blooded, or warmly clad themselves. My experience is that in toughening children by careless dressing and feeding, only the naturally tough ones live. The delicate are sure to die in the process, and many a delicate, frail little baby, by judicious dressing and feeding, have made robust men and women.

I must say a word about the flannel band that most infants wear the first six or eight months of their lives. After the first month I put them aside forever, because my warm flannel shirt and waist keep baby's bowels perfectly warm, and I claim that no child needs bandaging *anywhere* to keep it in shape, as most people seem to think. Give children loose, warm clothing, to grow in, and they will repay your care by growing lusty, fat and active limbed. Should any desire patterns of my baby's shirt and waist, I should be most happy to supply them.

Domestic.

FAMILIAR TALKS---No. 14.

BY SNIP.

OH, these Editors! Wasn't it the height of impudence to make my receipt for mince-pies utterly unintelligible, and then ask me how I liked Thanksgiving and Christmas "pi." I had always heard that editors were very meek and submissive, and endure everything without talking back, but I don't believe it any more. Well, I will try it over again, and hope for better success. Here is the receipt I attempted to give to the readers of the AGRICULTURIST last month. One pound finely chopped beef—roasted or boiled; three pounds of apples, chopped; one pound of raisins; one-fourth pound of currants; one nutmeg; two tablespoonfuls of ground cinnamon; one tablespspnful of ground cloves; the grated rinds and the juice of two lemons; one pound of sugar; moisten with sweet cider. Let it seand all night. When using add two ounces of citron, cut in very thin strips. The original receipt calls for half a pound of suet, but if this is used another pound of apples will have to be added, and the pies will need to be served hot.

I see mention made of moss frames in the November AGRICULTURIST. Our little girl has just finished one that looks very neat and quite pretty. We sometimes find whole trees covered with moss suitable for such purposes. The moss does not vary much in color, but some of it is nearly as fine as the most delicate seaweed, and again it is more like lichens. If one can get diffrent colored mosses, I think such frames could be made very attractive. Not long since I saw, at a friend's, a small box painted green placed upon a stool, and set by the window, and filled with plants. I liked the appearance of it very much, but I thought I could improve the looks a little. So with aid from a friend I have a piece of rustic work that elicits praise from all who see it. The supports for the box are made of manzanite. The limbs of this tree grow in such varied shapes, and the bark is red and so smooth, that it only requires to be cut in the woods and nailed together. The box is of a size suitable for the window, and about a foot deep, and covered with twigs of moss, or, rather, with twigs of trees covered with moss. These twigs are fastened on with tacks and twine. I have Colisium, or Kenilworth ivy planted around the edge of the box, which will soon droop over the moss. This ivy is a delicate plant, and is suitable for hanging baskets and rockeries. One silver fern, two golden ferns, a violet root and a Calla lily are all I have in the box at present. I intend to try and make a smilax run over the legs of the stand,—there being some twelve or thirteen of said legs. I am a little doubtful about it, however, as the smilax will be obliged to grow without much light. I will report in the future.

UTILIZING THE WILD FEED upon the great plains is a money-making business. Says the *Colorado Farmer:*

Stock raising, the most important pursuit in Colorado, next to mining, has already attained mammoth proportions and is undoubtedly one of the most profitable. In this business the returns are large with comparatively small risks, and it does not require much capital to be invested in labor or machinery, &c., that almost any pursuit necessitates. By an investment of $5,000 to $10,000 in common or Texas cows, and a complement of grade or blooded bulls, a man is sure of a fortune in ten years. Texas yearling heifers can be bought for $7 to $10, and two-year-olds for $12 to $15, and good grade bulls for $60 per head.

GREGORY'S SEED CATALOGUE. — Our readers will find the catalogue of J. J. H. Gregory's well known seed house advertised in our columns. For freshness reliability of the seed sent out, and enterprise in introducing choice new vegetables to the public, Mr. Gregory is endorsed by the prominent agriculturists of the United States; as recommendations from over forty States and Territories, to be found on the cover of his catalogue, amply attest.

☞ Since the removal of the Chicago dry goods store, and the filling with new goods the large, comodious room now occupied, it has still more increased in popularity. Everything that one can wish to see, broadly displayed, gentlemanly attendants, low prices, etc., all are enough to account for the rush of ladies who are purchasing winter and holiday goods.

☞ Our readers will please take notice of the Buyers' Commission Agency advertised in this No. The editor is personally acquainted with the parties, and can vouch for their integrity and business ability. The small commission they ask will be more than covered by the bargains they can secure. No matter what you want, whether holiday or everyday articles. Give them a trial, and, our word for it, you will not be disappointed. The ladies will notice that a lady is connected with the Agency.

RUPTURE!

Use no more Metalic Trusses!
No more suffering from Iron Hoops or Steel Springs! Our MAGNETIC ELASTIC TRUSS is worn with ease and comfort, Night and Day, and will, and has, performed radical cures when all others have failed. Reader, if you are ruptured try one of our Comfortable Elastic Appliances. You will never regret it.

Agricultural Implements
SEASON OF 1876-7.
THE FARMERS' UNION
AT SAN JOSE,
And Branch Stores
Are now selling all the most superior and desirable Seed-time implements, among which we call special attention to
The John Deere Gang and Single Plows, The Gorham Seeder and Drill, The Fon Du Lac Harrow, The Nash & Cutts Separator, The Cahoon Seed-Sower, Etc.
The GORHAM has proved to be the Drill best adapted to California Farming; is just the thing that every good farmer should have.
The Fon du Lac Harrow is the best, made of Wisconsin oak, angular steel teeth, free couplings—needs only to be seen to be appreciated.

SMITH & RYDER,

JEWELERS.

Commercial Bank Building,

307 *First Street, San Jose, Cal.*

My Annual Catalogue of Vegetable and Flower Seed for 1877 will be ready by January, and sent FREE to all who apply. Customers of last season need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed house in America, a large portion of which were grown on my six seed farms. Printed directions for cultivation on every package. All seed sold from my establishment warranted to be both fresh and true to name; so far, that should it prove otherwise I will refill the order gratis. As the original introducer of the Hubbard and Marblehead Squashes, the Marblehead Cabbages, and a score of other new vegetables, I invite the patronage of all who are anxious to have their seed fresh, true, and of the very best strain. New Vegetables a specialty.

JAMES J. H. GREGORY,

FARMS! FOR SALE.

1840 Acres of good Farming Land 1½ miles north of Ellis' Station, at $12 per acre; a splendid crop this year; will sell a part or the whole.

137-100 Acres—Cherry Vale, 3½ miles from San Jose, in the Willows. The best Cherry Orchard in California. 1230 cherry trees, 600 Prune, and variety of Peach, Pear, Apricot, etc. Also, 2000 Grape Vines four years old. Two Wells with 7-inch pumps, Horse-power, Steam Engine for lifting water, 3200 feet Under-ground Water Pipe for irrigating. Plain House. Orchard fenced and sheltered with Lombardy Poplars. Very complete place, and A BARGAIN at **$13,500.** Terms—$7,000 cash; balance on time at 10 per cent. annually.

164 Acres, Seven Miles West of City of San Jose, mostly valley, very cheap, Fair House, at **$6,500.**

223 Acres, Near Cinnabar Hotel, on Almaden Road, six and a half miles out; a Big Bargain for **$12,000;** has a Fine Grove of Timber, House, Barn, Wind-mill, Vineyard, etc; all valley land but 60 acres. Terms—One-half cash; balance in three years at 8 per cent. per annum.

40 Acres, Two and a Half Miles West, rich valley land, at **$80** per acre.

291¼ Acres, Near Washington Cor- ner, Alameda county, 15 miles from San Jose, one mile from Depot; all valley land; House, two Barns, large Dairy House, Granary, Wind-mill, Tank, three acres of Excellent Orchard, is a first-class place, at **$90** per acre, part cash.

50 Acres, on the Almaden Road, Six miles out, House, Barn, etc.; a pretty place for **$5,000.**

370 Acres near Evergreen; 80 acres in vineyard and orchard, 90,000 vines in full bearing; 250 acres in cultivation; house, barn, and good fencing; in the Warm Belt, 6 miles east of the city. A good investment for some one acquainted with business. The reason for selling is that the owner is old and desirous of retiring from business. Price, $20,000.

210 Acres 6 miles southwest of the city, on the Saratoga road, finely improved; good soil; all valley land; orchard and vineyard. A good farm and offered very low as the owner has gone into other business. $71 per acre.

80 Acres 6 miles west of San Jose; house of three rooms; good fences; two wells; orchard of 150 trees. Price, $6,650.

160 Acres 5½ miles west, of Santa Clara; house, fencing, etc. Offered very low, at $45 per acre.

80 Acres 8 miles west; all valley land; fair improvements; house, well, fencing, etc.; some fruit. Price, $5,500.

90 Acres near Lawrence's Station, at $100 per acre. A good farm, with good improvements.

160 Acres near Saratoga; 80 acres valley, balance low hills; hog-tight fence; 3 fields; running stream of water; good orchard and house. A bargain, for $6,500.

160 Acres 9 miles south; 100 acres cultivatable, balance pasture; house, barn, and milk-house; all fenced; both spring and running water. Price, $4,000; one-half cash, balance on time to suit.

159 Acres 8 miles from San Jose; house, barn and outbuildings; 15 acres in grapes, balance good, cultivatable land; running stream of water for ten months in the year. $6,120; one-third cash, balance in one and two years at 10 per annum.

35 Acres 5½ miles from San Jose, with some fruit trees; 20 acres under cultivation; 12 acres in grapes. $5,000; one-third cash, balance in one and two years at 10 per annum.

510 Acres; all under cultivation; nice house and large barn; picket fence; 140 fruit trees; nine miles from Santa Cruz road. $17,000; terms to suit.

537 Acres eight miles from San Jose; 100 acres in vineyard; balance under cultivation; 2 houses, 2 barns and outbuildings; good fence; 4 fields; several springs and running water; will be sold in parcels to suit. Price for whole, $30 per acre; one-half cash, balance to suit.

27 Acres 5 miles from San Jose; 100 fruit trees; 15 acres in vineyard, all foreign grapes; first-class house of 6 rooms, marble mantle; nice barn, good well of water, buggy, horse, plows and harrows. A fine place, and well worth looking at

J. C. BLAND & CO.,
Real Estate Agents
—AND—
GENERAL AUCTIONEERS,
312 Market St., San Jose,

HAVE FOR SALE, IN SANTA CLARA AND adjoining Counties, a very fine list of Grain and Stock Farms, improved and unimproved, in in tracts from 10 acres to 10,000, which they offer upon easy terms and at low prices; also, a large list of Business and Residence property in Santa Clara and San Jose. We append a partial list. Having resided in this county for 26 years, and being thoroughly posted as regards Real Estate Values, we respectfully solicit all in search of Houses, Stock, or business of any kind to give us a call.

10 Acres near the town of Santa Clara, with fine House and Out-buildings, good Orchard, Ornamental Trees, etc. Price, $10,000.

20 Acres of Unimproved Land in the Willows, being part of the Lupton Estate. Price $3,000.

80 Acres, under fence, all in cultivation; has a House of 4 rooms, Barn and Stable-room for 15 horses, good Well, sprinkled water. Also, 52 acres adjoining, with Redwood House, Barn, etc., good Well; all under cultivation. Price, $55 per acre.

21 Acres of fine land, 3 miles from San Jose, east of Coyote, well enclosed, good Adobe House, Large Barn, etc. Price, $4,000.

38 Acres of fine land, 2 miles south of San Jose, lying between the Monterey Road and the Coyote Creek. The soil is unsurpassed, and the location beautiful. Will be sold as a whole, or in three subdivisions; 22 acres fronting on Coyote, at $225 per acre; 8 acres between the two residence lots, at $300 per acre; 16 acres including the fine improvements for $5,000.

60 Acres of as fine land as can be found in the county, with fine improvement. Will sell low if called for within next 90 days; must be sold in that time. Situate one mile from Lawrence Station, S. P. R. R.

18 Acres fine Vegetable Land, 3 miles southeast of San Jose, on east side of Fully Road; has a Dwelling of 6 rooms (two-story house); Barn, etc.; Orchard and Vineyard of 5 acres; Cows, Wagons, Farming Implements, etc. Price of whole, $4,500.

1,000 Acres of fine Grain and Fruit Land, located near Los Gatos; will be sold in tracts to suit at from $40 to $60 per acre. Terms easy; prices low; must be sold within 90 days.

76 Acres rolling land 8 miles west of San Jose, adjoining Reynolds' farm. Small house of 6 rooms; nice running stream of water; well fenced; with plenty of wood on the premises. Price, $2,800.

108 Acres land on San Jose and Santa Cruz road, near Los Gatos, 5 miles from San Jose; excellent land, and will produce anything; improvements consist of a dwelling which cost $2,000, a good barn, fine orchard and vineyard; good well, wind mill and large tank. Terms, ½ cash; balance on time. Price, $95 per acre.

88 Acres fine land 6 miles west of San Jose, near Lawrence Station; well improved. Price, $100 per acre, on reasonable terms.

290 Acres 5 miles west of Gilroy; 30 acres vineyard; 10 acres orchard, all kinds of fruits; 3 living streams of water; all under fence; has a good house, ba n and other out buildings; wine cellars. Terms easy. Price, $10,000.

Stock farm of 2,000 acres, enclosed with brush fence and natural boundaries, located about 10 miles east of the 18-mile house, near Bennett's stock farm; well improved; has a good dwelling, barn, corrals, etc.; 80 head of American cattle, 45 of which are cows, balance one and two year olds. Terms easy. Price, $3,000.

42 31-100 Acres land on the road Guadalupe Mines, near the Los Gatos road, adjoining lands of F. Richmond. Terms easy. Price, $3,000.

242 Acres fine land, near San Jose; will be sold on a long credit. $5,000 cash; balance in 6 years, equal annual payments, with interest at 10 per cent per annum.

200 Acres of excellent fruit and berry land near Santa Clara depot. Price per acre, $200.

200 Acres in Alameda county, on west side of county road leading to Oakland, about one mile from Warm Springs, near Mission San Jose. It is fine black loam soil, well fenced. Has a good house and barn, etc. Price, $90 per acre; one-fourth cash; balance in one, two and three years, approved paper bearing one per cent. interest.

500 Acres of extra fine grain land 5 miles southwest of Watsonville and 1½ miles from shipping point, will yield 40 to 60 bushels per acre. Terms to suit purchasers. Price, $50 per acre.

160 Acres of pre-emption claim 35 miles southwest of Salinas City, 10 miles west of railroad terminus. Small house, good fence, out-houses, etc.; with an outside range of 800 acres, all finely watered. This is one of the finest hay ranches to be found in the country. Price, $1000; or will exchange for San Jose property.

160 Acres of fine timbered land located just on the line between Santa Clara and Santa Cruz counties. No piece of property on Santa Cruz mountains to excel it. Price, $5,000.

120 Acres fine land adjoining village of Saratoga; enclosed; title perfect. Price per acre, $50. Also, a farm of 160 acres 1½ miles south of Saratoga; good dwelling, barn, orchard and vineyard. Price, $4000.

81-Acre farm 4 miles northeast of San Jose; is a choice piece of land, with house 18x24 feet, small barn, etc. Price, $7,000.

Auction Sales of Stock, Carriages, Furniture, etc., in front of Salesroom, No. 312 Market st., every SATURDAY, at 10 a. m.

☞ Special attention given to Auction Sales in any portion of the State, at short notice.

J. C. BLAND & CO.,
Real Estate Agents and General Auctioneers.

SAN JOSE
INSTITUTE
—AND—
BUSINESS COLLEGE.

A Day and Boarding School for Both Sexes.

THE SECOND SESSION OF THE TWENTY-Ninth School Year will commence October 20, 1876.

In acknowledging the kindness of the patrons of this School, the Proprietors desire to assure them that with the increased patronage will be added increased facilities for imparting instruction. They intend that the School shall offer the very best opportunities for acquiring thorough education, both theoretical and practical.

The course of study in the Academic grade is extensive and thorough.

The Business College has no vactions.

Students from a distance will find pleasant rooms and board at reasonable prices at the boarding-house.

The Faculty accept to its fullest extent the growing demand of the industrial classes for recognition in the public educational system hailing it as the harbinger of a higher and better civilization.

ISAAC KINLEY,
Superintendent of the Institute.

1776 **CENTENNIAL** 1876
PROCLAMATION.
Chicago & Northwestern Railway.

Is the popular route overland to the East. Passengers for Chicago, Niagara Falls, Pittburg, Philadelphia, Montreal, Quebec, New Y Boston, or any point East, should buy ir trans-continental tickets via the pioneer etc.

THE CHICAGO &NORTHWESTER R.R.

This is the Best route East. Its Track is of Steel Rails, and on it has been made the Fastest time that has ever been made in this country. By this route passengers for points east of Chicago have choice of the following lines from Chicago:

Pittsburg, Fortwayne and Chicago and Pennsylvania Railways.

•) Through trains daily, with Pullman Palace •) Cars through to Philadelphia and New York on each train.

THROUGH TRAIN, WITH PULLMAN PALace Cars to Baltimore and Washington.

By the Lake Shore and Michigan Southern Railway and Connections (New York Central and Erie Railways):

•) THROUGH TRAINS DAILY, WITH PALACE •) Drawing Room and Silver Palace Sleeping Cars through to New York.

By the Michigan Central, Grand Trunk, Great Western and Erie and New York Central Railways:

•) Through trains, with Pullman Palace Draw- •) ing Room and Sleeping Cars through to New York to Niagara Falls, Buffalo, Rochester, or New York city.

By the Baltimore and Ohio Railroad:

•) Through trains daily, with Pullman Palace •) Car from Newark, Zanesville, Wheeling, Washington and Baltimore without change.

This is the Shortest, Best, and only line running Pullman celebrated Palace sleeping cars and coaches, connecting with Union Pacific Railroad at Omaha and from the West, via Grand Junction, Marshall, Cedar Rapids, Clinton, Sterling and Dixon, for Chicago and the East.

This popular route is unsurpassed for Speed, Comfort and Safety. The smooth, well-ballasted and perfect track of steel rails, the celebrated Pullman Palace Sleeping Cars, the perfect Telegraph System of moving trains, the regularity with which they run, the admirable arrangement for running through trains to Chicago from all points West, secure to passengers all the comforts in modern Railway Traveling. No changes of Cars and no tedious delays at Ferries.

Passengers will find Tickets via this Favorite Route at the General Ticket Office of the Central Pacific Railroad, Sacramento, and in all the Ticket Offices of the Central Pacific Railroad.

Sewing Machines

REDUCED PRICE, $35.

Home & Home Shuttle Sewing Machines

Reduced to Live and Let Live Prices.

THESE MACHINES ARE ALL SUPERIOR to any and all; nice sewers, straight needle, two threads, shuttle, lock-stitch, the simplest and cheapest, and the lightest running first-class machines in the market. To see is to convince yourselves. ☞ Remember, all Home and Home Shuttle Sewing Machines have the Hall Treadle attached without extra charge.

THE HALL TREADLE

For Sewing Machines,

THE MOST IMPORTANT IMPROVEMENT EVER MADE.

It saves labor and preserved health. No more diseases and deaths, side or back aches from using sewing machines. No teaching required. A child can run it. Always starts the right way. Never goes backwards and breaks things. Can be stopped instantly. Will fit on your machine, you can do double the work you can do without it. Fifty stitches can be made with one pressure of one foot. Approved by the Massachusetts State Board of Health (see official report, 1872), Mesachusetts Medical Society, and Mssachusetts Charitable Mechanics' Association. The HALL TREADLE is a part of all HOME MACHINES sold by me.

☞ The Hall Treadle can be attached to any other sewing machine. Remember that we will attach it onto any machine. It will cost you only $12, and will save you a deal of hard work and trouble.

THE HALL TREADLE GRINDING MACHINE

Must be seen to be appreciated. For a Farmer or Mechanic to see it, is to buy one. It is an indispensable article in every house, shop or hotel.

THE HALL TREADLE JIG SAW AND BORING MACHINE

Is an accomplishement to every workshop. The Hall Treadle is applicable to all machinery requiring a foot power—Sewing Machines, Grindstones, Jig Saws, Turning Lathes, Jewelers' and Dentists' Lathes, etc. Send for circulars.

OUR MACHINIST.

In connection with my regular business, I have a fine MACHINE SHOP, for repairing all kinds of machines and like work, and have employed MR. CHARLES G. THOMPSON, a Skilled Mechanic, as manager, and am now prepared to repair machines and machinery, make models, etc., on the most reasonable terms, and ALL WORK GUARANTEED.

Something New, Ladies!

Just What You Want for Yourself and Children.

DON'T FAIL to SEND FOR a PATTERN

Comfortable Combination Clothing.

THESE SUITS ARE CALCULATED FOR Healthfulness, Comfort and Convenience, and will fit the most fastidious person. Explanations accompany each Pattern. Patterns of four different styles of Suits are now supplied, viz.:

New Price List:

1—Cal. Combination Suit, for flannel.....55 cts.
2—Combination Suit, Muslin.....65 "
3—Excelsior Suit, Muslin.....80 "
4—Bodice with Yoke for Skirts.....65 "
5—Yoke Band for Skirts.....25 "

THESE STYLES OF UNDERCLOTHING for Ladies have been found by all who have used them, the most convenient and comfortable, as well as economical of any now in use. Models were exhibited and attracted much commendation at the late Fair.

Patterns can be had by applying to **Mrs. Herring,** east side of Ninth street, between St. John and St. James streets, San Jose, (where samples can be seen,) or by addressing

C. C. C. Company,

Box 686 San Francisco.

This reform underclothing has been worn by the Editor's wife and children for the past two seasons, and is certainly superior in points of comfort, healthfulness, and economy of wear and material of any ever invented. They are the invention of a California lady who makes every pattern herself and writes full directions upon each. No family that once tries these styles of clothing will ever go back to the others.

THE SINGER
SEWING MACHINE ROOMS.

Over 146,000 more Singer Sewing Machines sold in 1875 than by any other company.

ANCIENT AND MODERN AGRICULTURE.

BY JOHN CHAMBERLAIN.

The history of agriculture is pre-eminently an interesting and instructive study, since upon this great industry the prosperity of society has mainly rested from the remotest times.

From evidence furnished by the antiquarian and geologist we conclude that man in his primitive state lived by the chase, and with his rude stone weapons disputed the dominion of the earth with monstrous beasts.

We know very little concerning the vast period of time which elapsed between that and the hieroglyphical age, for science, the great magician, has not yet succeeded in opening this charmed volume of the world's history, and the origin of agriculture is therefore unknown. At the earliest dates of which we have any information, transmitted by pen, or chisel and hammer, agriculture was already in an advanced and flourishing state. As far as we know it had its origin in the valleys of the Nile, Euphrates and Tigris, which were probaly densely populated more than a thousand years before Joseph became Pharoah's minister of agriculture. Upon the ancient tombs and monuments of Egypt inscriptions and paintings, apparently as distinct as ever, represent rural scenes not unlike modern ones. Villas are depicted, surrounded by cultivated gardens and fields, irrigated by means of canals and reservoirs. Laborers are seen plowing with oxen, others harrowing, while others make the surface of the field smooth and compact with rollers. We judge from these inscriptions that the Egyptians had as complete and intelligent a system of agriculture, under the dynasty of Merus, 5000 years ago, as they possess to-day; nor is the fact true of the Egyptians only, for good authorities aver that no material improvement over the ancient methods and processes was made until about the beginning of the 18th century. When Egypt was a province of the Roman Empire, she sent twenty million bushels of wheat to Rome annually. Pliny mentions that thirty-four stalks were grown from one seed in Mycias and sent to the Emperor Nero. Speaking of the soil, the same author remarks that when dry it was so stiff it could not be plowed by the strongest oxen; but when softened by rain he had seen it opened by a wretchd ass on the one side and an old woman on the other.

Agriculture was not esteemed a very honorable pursuit by the dominant classes of the ancient Greeks, and was chiefly carried on by the lower orders, who were descended from the original proprietors of the soil.

The Romans on the contrary were an agricultural people, and Roman noblemen, scholars, philosophers and poets, delighted in agricultural pursuits and rural pastimes. Distinguished Roman families took the names of favorite plants or cereals, as the Sentuli, Fabii, etc. Wherever the Romans extended their conquests they introduced their excellent system of agriculture, traces of which can now be seen in nearly every country in Europe, and, indeed, in southern Italy, agriculture if anything has degenerated since the days when Virgil and Varro wrote and sang of all the husbandman's toils and pleasures, and the bounty of Ceres. But the Romans degenerated. Latterly the chief supplies sent to Rome from her provinces were the product of slave labor, the more powerful patrician families having seized in many instances, and acquired by fraud in others, the provincial lands which they worked with slaves.

The free husbandman, deprived of his few acres allotted to him under the law, became a mere retainer or dependent of his powerful landlord. The agrarian laws designed to prevent or break up such an unjust monopoly became a dead letter; and thus by injustice, fraud and violence an easy way was prepared for the vandal and barbarian. The free husbandman had no longer any interest in a state or government which could not or would not secure him his rights. Robbed at once of his lands and independence, his patriotism had neither soil nor nourishment, and died; for the home of patriotism is not in the political club, nor cabinet, nor legislature, but by the firesides of freemen. After the barbarians overran Europe agriculture rapidly declined, and with one exception did not begin to recover until about the 17th century. The exception was in the case of Spain after her subjugation by the Saracen, who established an extensive system of irrigation, and so developed the agricultural resources of Spain that her annual revenues were raised to thirty million dollars, a sum, says Gibbon, which in the 10th century probably surpassed the united revenues of all the christian monarchs of Europe. We can easily judge of the backward state of agriculture in England, even as late as the 17th century, from the fact that up to that time what are now common vegetables were imported to supply the royal table.

The first English book on agriculture was published in 1523, by Fitzherbert, and entitled the "Boke of Husbandrie." It was followed by "Five Hundred Points in Good Husbandrie," in doggerel verse, and after that by the "Whole Art of Husbandrie," by Barnaby Googe. Says a good authority, "The experiments and writings of Jethro Tull in the early part of the 18th century are among the first important attempts in real progress in modern agriculture." Tull invented the horse hoe and drill husbandry in England, also the threshing machine, according to some authorities.

Tull was followed by Arthur Young, to whom the world is greatly indebted for the spread of agricultural knowledge. He was born in 1741. He travelled extensively and observed closely, and established among other facts the value of common salt as a manure, besides making valuable experiments to ascertain the effect of the sun's rays on soil. The most important movement, however, in favor of agriculture, about that time, took place in 1793, by the organization of the Board of Agriculture in England. Encouraged by this body, Sir Humphrey Davey began his celebrated investigations. He showed how plants, soils and manures could be analized, and manures selected which would furnish the elements, and made experiments with ammonia, specimens of guano, etc.

The ancient implements of agriculture among the Greeks, Egyptians and Romans were the harrow, hoe, roller, plow, etc.

A plow similar to the modern one was used in Greece one thousand years B. C. In Egypt the shadoof and Persian wheel have been used in agriculture for five thousand years. During the last half century agriculture has advanced to the rank of a science. Chemistry tells us how to select and renew soils, steam plows tear up the prairie and plain, and steam is employed to thresh our annual millions of bushels, while labor-saving machines are multiplying so rapidly that the name "field laborer" may become a misnomer.

"If it doesn't rain,"—Well, what then? It begins to look serious, as we go to press. No rain yet to do any good, to start grain or nourish its growth.

For the last two years we predicted dry seasons, but got wet ones. We made the prediction on the ground that, according to records, about once in a decade there are two or three dry seasons in succession. Look at 1862, '63, and '64. Since then we have had very good seasons, and may expect a heavy dose of dry when the dry seasons do come again.

As we insisted last fall that farmers should hold their wheat for 2 cts. before selling, we now say: hold on to your wheat at any price, if you can afford to. Don't sell it till you know whether it will rain enough to bring another crop. If it doesn't you will do a nice thing to hold, for it will all be needed at home. If it does rain it will still be worth a fair price, as it cannot lower in price much before another crop is harvested.

If it doesn't rain to bring a crop, summer fallow every acre of land that you can. Get rid of all surplus stock, sell or kill the animals of least value, and save the best young stock and best breeders only. Husband your straw and hay carefully. The wise farmer has two or three years' straw stacked and on hand, to carry his stock through a dry season.

Prepare to irrigate with windmills and engines, and cultivate a small place anyhow, so such products as will grow the most needed food to the acre. It is time to begin to prepare for the worst, although the best may be hoped for.

Now one piece of advice in which we are specially interested. Whether it is wet or dry, renew your subscriptions to the CALIFORNIA AGRICULTURIST, and we promise to give you such a fund of valuable information on all most needed points as will pay you ten times over. We are interested in making the AGRICULTURIST an indispensable companion and reference book for the farmer, gardener, orchardist, stock grower, poultry raiser, and family, wet or dry, and especially "if it doesn't rain."

Numerous Enquiries are made about the young man, Hamilton, who once canvassed for the CAL. AGRICULTURIST, and who has later published the *Journal of Education*, in San Jose. He is a first class bilk. He defrauded the publishers of the AGRICULTURIST out of between $30 and $40, and we believe that he started his *Journal of Education* on purpose to defraud the people. Many who have paid subscriptions have not received a paper. Rowell's *Newspaper Reporter* announces its suspension. Hamilton's real name is said to be O'Grady. We advise our readers to have nothing to do with him.

The Spirited Center Piece, in first page of cover, engraved by our special artist, is characteristic of the times. It illustrates at once the work of the season, the sort of a team that is the most profitable for farmers to raise and use, and that the agriculturist of the present day has an easier time with his modern gang, where he can ride and direct the work, than the old-time plowman at his plowtail. Contrast that picture with this, and be thankful that you live in an age of mechanical as well as agricultural improvement.

A Grand Barbacue was given last month at Berryessa district, four miles east of San Jose, by the settlers: a rejoicing over the final defeat of a bogus Mexican land claim that had been hanging over them for many many years. There were many homes of settlers in dispute now rendered peaceful by a just decision of the Supreme Court. Half a million dollars worth of real estate was involved, in a tract reaching from the summit of the mountains east to the river limiting the city lands. We were there and feasted with the good people on the occasion, and rejoiced with them with a joyful heart.

Pumpkin Flour.—The Alden Fruit Drying Co., of San Jose, have this season made a quantity of pumpkin flour. The pumkin or squash is first dried and then ground fine. This preparation is certainly very excellent for pies, puddings, mixing with bread, and for kitchen use in many ways. Try it once and you will want more.

Wheat Cuiture. in a dry season, should be adapted to the necessities of the occasion. Thin sowing, not over 50 pounds to the acre, and very thorough surface tillage, should be the rule.

Errata.—In our article on orcharding last month the peach called "George 4th" should read "George's Cling."

EDITORIAL NOTES.

Mr. A. Clock, of St. Helena, Napa county, has been notified that he was awarded the first premium for California hops, at the Centennial Exposition.

Late Plums.—Mr. G. W. Tarleton of San Jose, shipped 40 boxes of Coe's Late Red plums East the first week in November. They were packed without wrapping, simply in layers between paper. Some boxes of them were opened on Thanksgiving day and found to be sound and fresh as when packed from the trees, without a sign of decay or defect.

Shipping Pears.—Within the last two years there has been more of a demand than supply for late-keeping pears to ship East. The Winter Nellis and Buerre Easter are most in demand. The consequence is, that our nurserymen have had a run on them for all their pear trees by parties setting out new pear orchards to raise fruit for the Eastern markets.

This month we have devoted much space to forest and to grape culture, as being seasonable topics, requiring a good deal of attention. These have pressed out several Departments, which may be expected in future numbers with regularity. We propose to make our City Gardening Department, this year, as attractive as it was last. Also to make poultry and pet stock something of a specialty, while all departments, for IN DOORS AND OUT, will be as complete as our space will admit.

ORCHARDING.

Questions and Answers.

POMONA, LOS ANGELES CO., Nov. 22, 1876.

EDITOR AGRICULTURIST:—Availing myself of your invitation in your November number, which accidentally fell into my hands, I desire to consult you as to the "best fruits for an orchard" in Southern California. I will state my case as briefly as possible. I am a novice, and know nothing about the management of fruit trees, or farming; have twelve acres of deep gravelly loam, irrigating facilities; land irregularly worked for twenty years by native Californians, but excellent for all kinds of fruit; four acres in cultivation with orange, lime, and northern trees, alfalfa and raisin grapes, leaving eight acres to be set out in nothern fruits this season. To begin wrong would cause a failure, and prove fatal, and I would thank you sincerely for your advice on the following points: 1st—Proper preparation of the soil, how deep to be plowed, etc.; in barley this Spring. 2d—Best varieties of Winter apples, suitable to this climate. Earliest peaches and pears, and the proper proportion to be planted. 3d—Proper distances, and as to the advisability of planting peach trees between apples with a view of getting them down when the apple trees come in full bearing. As to distance there is a great difference of opinion, in fact I have not found two opinions that were not conflicting on any point relating to fruit culture; some advise 20 to 25 feet apart, while the school brings it down to 20 and 18 feet for apple—to shade the ground. 4th—Proper manner of setting out, arrangement of roots, depth, &c. 5th—Orchard clean, or in grass—and what kind. 6th—The best time for planting. 7th—The value of small fruits as compared with large, where the market is distant. 8th—Best and earliest varieties of black-and raspberries, and where obtainable. 9th—Information as to true Muscatel and Zante grape vines, where obtainable. 10th—Muscat, Muscat of Alexandria, Muscatel and Malaga—these terms are confounded, what is the difference? 11th—The most extensive and reliable nursery of choice fruits in California, or the East if shipment is preferable. 12th—Anything that may suggest itself to you. I would extend my inquiries still further, but have already presented so much, and the only apology I can offer is that of a beginner who is anxious to avoid mistakes, and get and counsel of men of experience. But as the majority of settlers in this section find themselves in the same predicament, information on the subjects referred to is of general interest and value. Lastly, Is there any publication treating practically on fruit culture in California?

Very Respectfully Yours,

CHAS. WEILE.

Answers to several of the questions asked by our correspondent will be found in our article on orcharding in the December number. We will, however, give such advice as we are able, in the order in which the questions are presented:

1. The soil should be thoroughly pulverized to a depth of four to six inches at least, if not already in that condition.

2. We refer you to our list of apples given last month. Your climate may require a little different selection, but we think not. The list of peaches we gave last month is suitable for San Jose. The earliest peach is Briggs' New Red May—which originated at Marysville in this State, and is ahead of any other. The earliest pears are Dearborn's Seedling, Madaline, Buerre Gifford, Bloodgood. These are valued principally because they are early. The first really valuable early pear is the Bartlett.

3. We are satisfied that 18 to 20 feet is far enough apart to plant your trees, not so much to shade the ground, though that is well enough, as to best economize the land and produce the most good fruit to the acre. Plant all trees equally distant, to facilitate cultivation. To be sure some trees will bear closer planting than others, but a general average should be decided upon. We do not advise mixing the different sorts of trees together, though there is no reason why they will not do very well that way. You will find it handier to get at your fruit to have all different kinds and varieties by themselves.

4. The manner of setting out trees was given last month.

5. Never allow grass, grain or weeds of any kind to grow in your orchard, whether you irrigate or not, and particularly if you do not irrigate. Nothing will sooner ruin an orchard than to grow grass or grain in it. The surface soil should be kept light, clear of weeds, and be manured every two or three years at least, if you want to produce fine, large, high-priced fruit. When irrigation can be resorted to, low, hoed crops may be cultivated between the rows two or three years; but allow no corn, grain, nor grass, to grow in your orchard.

6. The best time, is as soon as the rains wet the soil enough to make it handle nicely, and the frosts have caused the leaves of the trees to begin to fall. Early planting in California, for all deciduous trees is best.

7. The value of small fruits as compared with large, where the market is distant is not much, particularly if you depend upon shipping it green. Do not think of shipping perishable fruits a long distance to market in competition with the same produced nearer the same market.

8. Our market fruit gardeners produce the Wilson, Kittatinny, and Lawton blackberries, and the Falstaff, Knevitt's Giant and Red Antwerp raspberries.

9. We must advise you to enter into communication with some of the leading raisin growers. Will any subscriber who has cuttings for sale, true to name, please answer?

10. We think there is "a distinction without a difference" between several of the muscat family of grapes. Some reference to them can be seen under the Vineyard Department in this issue of the AGRICULTURIST.

11 We cannot advice the purchase of trees from the East. Our California nurseries can produce better trees for orchard planting. If you were going into the nursery business, it might be well to get quantities of small stock and seedlings from Eastern nurseries for a starter, but for an orchard, take California grown trees by all means, and buy them too of RELIABLE nurserymen—not agents or tree peddlers. This is our advice all the time. There are several very reliable nurserymen who have extensive nurseries in this State. At the risk of showing favoritism, we will mention John Rock, of San Jose, as one of that sort. We know him to be reliable.

12 As to hints, we cannot claim to know all about your special locality, as to what varieties of fruits are best adapted to your climate and to your market. Each locality must determine these things for itself. Were we going into orcharding in your locality, we would take the precaution to go to every intelligent orchardist there and get their special opinions, and reasons, on these points, take notes, and by comparison, determine as well as we could what varieties are best, etc. Then you must take into consideration that the building of railroads will produce new markets, and require a different class of fruits for profit from your local market. The new road finished last year connecting you with San Francisco, Sacramento, and the East, must change things in these particulars. A road opened across the southern plains to the East, will open another new market, and you will do well to consider this fact also. We will say that our best shipping fruits from this point (San Jose) are Winter pears and best keeping plums and prunes. There is also a demand for a portion of the grape crop—select table grapes—at paying figures.

No book on fruit culture in California has yet been written. Fruit growers are just beginning to accumulate reliable data for such a work, in their experience. It would be an easier matter to write up their mistakes than to frame out a really reliable work for fruit growers' guidance in California to-day.

The information we gave last month contains more reliable matter, from practical experience, than any other one article ever published on this Coast

RED SPIDER.

left—Can you tell me how to rid house plants of a small, red insect, very destructive, and not larger than the point of a pin? I had a beautiful and a very thrifty rose, that I brought indoors when the winter weather came; I soon noticed a change, but supposed it resulted from an indoor atmosphere. The leaves withered, and one by one the tiny buds dropped off. One day a friend called my attention to the insects, which I had not noticed. They were numerous on the few remaining leaves, and a web like that of a spider enveloped the bush. I removed the plant from among others, as a means of prevention; but in case of trouble again would like to know how to destroy the pests without injury to the plant.

SETTING MILK.

24—Does it make any difference with milk in regard to the cream rising, whether pans are covered or not? Once lived in the country and made butter and cheese; but never thought to notice such things. I now have the milk from one good cow to manage, and have noticed on several occasions that when I covered the pans I did not get nearly so much cream as when left uncovered. I mean close covers, such as a naughty rat that loved cream would compel one to use. Have I just discovered what others may have known for ages, or has anybody else thought anything about it?

M. E. T.

1. The insect our correspondent refers to is the red spider. It is a very annoying pest, and is getting to be very plentiful and troublesome in California, on many kinds of plants, in doors and out. Tobacco smoke will kill them, also a soap suds and cayenne pepper. Fumigation with tobacco or sulphur is the resort for their destruction by gardeners when they infest plants in green houses.

2. It is a well known fact that cream will raise better in open vessels in a well ventilated room, than in close rooms, or in covered vessels. The milk should be exposed to the air, always, until the animal heat is entirely out of it, and the peculiar smell of new milk has evaporated. After that the cream will raise very well if the pans are covered, but the cream will be softer and more oily than if left exposed to the air, will not seem to be as thick as it really is. Exposed to the air, the evaporation from the surface toughens the cream and makes it appear thick. Exposure to a pure atmosphere is quite necessary to the formation of a thick, rich and sweet cream, devoid of all taint or disagreeable odor and taste. If you cover from rats, first allow the milk to get thoroughly cold and to lose the animal odor.

The scholarly article on our first page this month is by our business agent, Mr. John Chamberlain, who has taken the field this year to travel over the State in the interest of this journal. We trust that, with the aid of our friends everywhere, he will be able to contribute such reports from different sections as will make the AGRICULTURIST at once attractive and valuable to readers at home and abroad.

The Editor has been somewhat remiss in his duties during the last month, owing to the severe illness of his baby, who came near dying with diptheria. He felt it a first duty to try to save him, even if he neglected everything else, and lost subscribers. For days and nights his unremitting attention was required, while letters accumulated and went unanswered. The baby's life has been spared, only because it was under the treatment of a mother who had knowledge of the disease, and of how to treat the child intelligently for it. He was not dosed with medicines, but Nature was aided in resisting the disease and restoring the baby to its normal, healthy condition, in a rational, common sense manner.

Next month, JEWELL will tell mothers how she treated the disease, if nothing prevents.

THE RURAL NEW YORKER, one of the leading agricultural papers is as progressive and enterprising as ever. It is a splendid paper to have in the family. Terms, $2.50 a year. Rural Publishing Co., 78 Duane Street, New York.

Poetry.

[For the Cal, Agriculturist.]

Florida to California.

BY MINNIE B. BIZER.

BRIGHT land of the sunset, my heart turns to thee,
Sweetest home of the orange and vine!
Thy fame hath been wafted in fragrance to me,
Like an incense from some hallowed shrine;
I have breathed the sweet breath of thy bridal blooms
When not many days plucked from the bough,
And dreamed that I stood in a valley where looms
The tall mountain with snow-covered brow.

While yet in the Northland, where winter's chill breath
Blights the labors of Nature's kind hand,
I read of thy shores, where no annual death
Spreads its gloom, like a pall, o'er the land,—
And longed so to dwell in some beautiful vale,
Basking there between mountain and wave,
In a home where the breath of blooms on the gale
Is the sweetest that earth ever gave.

Since then to this far away Southland I came,
In vain search of a climate like thine,—
A winter I've passed, and a summer of flame,
While King Sol in his vengeance did shine;
In this famed "Land of Flowers" more than a year
I have watched and I've waited to see
What allurement it claims to hold the heart here,
And in what its attraction can be.

'Tis not like the beautiful land of the West,
With its broad, fertile acres of mould,
Where all sowing seed on the dark earth are blest
With a crop yielding riches untold;
The health-beaming eye and the rose-tinted cheek
But few natives here ever may claim,—
Nor light-springing step, for the frame is too weak—
What is health here is only a name.

Then may the kind Fates bear me yet to thy shore,
Where the soft, fragrant air, like a balm,
Can to beauty and health the feeble restore,
While in orange grove singing its psalm;
For gale of the mountain, or breeze of the sea,
Or sweet zephyr of vale, 'tis as pure
As Eden's first breath, when from evil yet free,
And full many earth-ills it can cure.

Sweet land of the sunset! my hearts's only home,
Still I visit thee oft in my dreams,
And through thy fair vales, and o'er mountains, I roam,
And rejoice by thy musical streams;
Clime of climes! land of lands! no other below,
Can to me seem so dear, and so fair,—
To others farewell, when to thee I can go,
For I feel that my life-work is there.

WILBORN, FLA., Nov. 20, 1876.

For the California Agriculturist.

Falling of the Leaves.

BY J. BELL.

How silently they fall, without a sound
Save a faint rustle, as they one by one
In swift succession strew the frosty ground,
Mingling their colors in the morning sun,

And far and wide what beauty they unfold,
The forests glowing in their autumn dress,
Their pathways carpeted in green and gold!
Spread to our view a scene of loveliness.

We watched their coming in the early Spring,
We saw their freshness in the Summer's prime,
When 'neath their shade the feathered tribes would sing,
Now, changed and withered by the hand of time.

The falling leaves are whispering "death is nigh,
All earthly objects perish or decay."
This solemn warning brings a pensive sigh,
Knowing that we too, soon must pass away.

But glorious thought! we perish not as these,
The mortal dies, the immortal lives again,
"Dust unto dust"—the Spirit upward flees,
To heavenly joys, where death can never reign.

Our Father's sovereign care is ever all!
Each little plant, or strong aspiring tree,
Is watched and tended—not a leaf durst fall
Unnumbered or unknown, O God to thee!

Then, let me pass away, 'ere Winter's gloom,
Enfolds the earth within his icy shroud,
In Nature's freshness, while the flowers still bloom,
And heaven invites to rest—undimmed by cloud!

San Jose, 1876.

In the Woods.

How changed the scene from that I lately sang,
Of sunshine in the woods!
When all the leafy coverts rang,
Down to the deepest solitudes,
With sweet bird harmonies of song
From the wild-feathered throng.
But now the furious wind's sonorous bass
Sounds through the naked trees;
Musing spreads forth her wing
And in the air float melodies, which chase
Each other as they please
And gaunbol as in ecstasies;
Each tree a harp, and every branch a string,
Touched by a hand unseen, now low, now high,
Outringing rapturous refrains,
And with great heaven's own minstrelsy
Flooding the hills and plains.
Some tremulous leaves still hand upon the boughs,
Quivering 'twixt life and death,
And yonder willow sways, and sighs and bows
Before the frost hath breathed her wintry breath,
And the last leaf falls flickering to its tomb—
Relic of brightness and of bloom.
Walk through the wood, thrilled to the utmost core.
By the wild concert of celestial sounds
In God's cathedral. Hear the wondrous roar
Of nature's organ, echoing in rounds
From the high headland to the ocean shore,
Magnificently grand!
This is God's minster-choir,
By the blue heavens o'erspanned.
And now the song bursts forth the harp and lyre,
A hallelujah chorus loud,
A hurricane of sound which sweeps
Triumphant from cloud to cloud,
As though the very heavens were bowed;
And then in silence sleeps,
Sweet silence! like the cadence of a psalm:
The storm was sudden, and the hallowing calm
A sudden as the storm;
Not a breath stirs, and zephyrs soft as balm
Brings peace in its most lovely form.
Only the whispering rill I hear,
With its mild vesper hymn the trees among,
And, beautifully clear,
The robin's plaintiff song.

After the Storm.

After the storm, a calm;
After the bruise, a balm;
For the ill brings good, is the Lord's own time,
And the sigh becomes a psalm.

After the drought, the dew;
After the cloud, the blue;
From the sky will smile, in the sun's good time,
And the earth grow glad and new.

Bloom is the heir of blight,
Dawn is the child of night,
And the rolling change of the busy world
Bids the wrong yield back the right.

Under the font of ill
Many a cup doth fill,
And the patient lip, though it drinketh oft,
Finds only the bitter still.

Truth seemed oft to sleep,
Blessings flow to reap,
Till the hours of waiting are weary to bear,
And the courage is hard to keep.

Nevertheless, I know
Out of the dark must grow,
Sooner or later, whatever is fair,
Since the heavens have willed it so.

Be Sure You're Right, Then Go Ahead.

Adopt this beautiful motto—
Write it in letters of gold;
'Tis a saying uttered in wisdom,
Applies to the young and the old.
'Twill help us along in life's journey;
Nothing like starting aright;
Such action is pleasing to others
And fills us with inward delight.

Who can compute all the trouble,
The error, disasters and woe,
That occur from neglect of this duty?
Their number but few of us know.
Think and reflect before acting,
Weigh well the project in view;
Be sure of righteous decision
On whate'er you wish to pursue.

Those who've adopted this motto
Seldom have cause to regret,
It saves us a deal of misfortune,
Relieves us from worry and fret.
We jog along easy and happy,
On a wide and definite plan.
Assured of success in our labor,
By doing the best that we can.

The Harvest Land.

The daylight waning and the darkness near;
So little done, and still so much to do!
Before me the long night of cloud and fear,
Without one star to pierce the shadows through.

I hear the rumbling of the swaggering wains;
I hear the burden of the harvest song;
And, through the hazy light in happy lanes,
I see the sun-browned reapers pass along.

And I must lay my sickle down and go
From the dim fields that look so drear and lone;
Alas! that I have so few sheaves to show!
I shall not hear the Master say "Well done!"

With what regret I look back to the past,
When the long shadows loomed so far away;
And Morning seemed on every wakening blast,
To waft the whispers of an endless day!

So many misspent moments, wasted hours,
Playing with pebbles on the sea-washed strand;
Searching for butterflies, or gathering flowers,
Instead of toiling in the harvest land.

And now the night stole'n on me like a thief,
While yet I dreamt that it was scarcely noon;
Sad that the sunshine is so very brief!
Sad that the shadows fall so very soon!

O for one other hour of God's bright day
In which to work with sinew, heart and will,
Ere yet I leave the fields and pass away
To that mysterious sleep where all is still!

—[William Leighton.

The Threshing Floor.

BY AUGUSTA LARNED.

Come, Jenny, into the barn, dear,
Where Jack slings high the flail;
The golden stalks dance far and near,
The blows fall thick as hail.

So rich the tan upon his cheek,
So firm the graceful lines,
He stands like some inspired athlete,
In Sparta's ancient times.

The flail beats out upon the ground
A song that fills his ears;
"'Tis love that makes the world go round,"
This happy thresher hears.

The sun steals past the old barn door
That frames this upland wide,
And o'er the beams and on the floor
It plays at seek and hide.

The woods are caught in silver streams,
The meads are fresh and fair,
As through the vista of our dreams
Blue mountains rise in air,

And angels seem to walk in bands,
Along yon cloudy pile;
There may we fold our work-worn hands,
And rest within God's smile.

Two gray doves on the ridge-pole sit,
And sun their bosom's pride,
While swallows dart, and dive, and dip
In circles far and wide.

And while clouds pause the barn above
Like seraphs in the air;
For all the powers of peace and love
Surround a happy pair.

The earth is verdant for your sake,
The hills are fair to see;
The cautious echoes will not wake
To breathe love's mystery.

Jack's stout flail on the yellow grain
Will chaunt of home and rest;
The bread that's won to that refrain
Is sweetest to the taste.

And while you stand to knead the bread,
And Jack swings high the flail,
No cloud shall shade your golden head,
The love-light shall not fail.

Come, Jenny, into the barn, dear;
Ah trip your lightsome feet,
Our Jack shall cease the flail to hear,
And list his own heart beat.

The Ideal Farmer—And His Wife.

The American farmer—son of the Sun!
Bronzed with a glow from its glory won;
As the free air it is heaven to inhale,
And strong as the steeds of the prairie gale;
Lord of his castle and broad domain,
The herd his vassals, the flock his train,
And rich in the coin his granaries hoard,
He sits at the head of his bountiful board.
And laughs at the crowded world afar,
Buzzing with ceaseless commercial life.

Behold him at morn! his polished plow
Traces dark lines with its silver prow,
Writing the verse in alluvial mould
The Summer shall print in letters of gold;
And set to the trill of the oriole's tune,
Behold him at rest in the languid noon,
Stretched on the grass and cooled by the breeze,
His kingly pavillion the glittering trees.
Behold him at eve;—the evening his own,
Home joys are his that to few are known;
The rustet is brought from his last year's store,
His fruity-faced children play on the floor,
And her wife, her cheek like orchard bloom
Is the crown, the queen, of the cheerful room.

That mine of riches—that farmer's wife!
How busy and happy and proud her life!
From her pans she "pans out" her rolls of gold,
And her eggs are all nest-eggs of wealth untold;
It tries not her patience to try out her lard,
And her lot, like her bed is seldom hard;
She knits her stockings, but never her brows
Gives the fowls a dressing, but not her spouse.
O! busy and happy and proud the life
The farmer lives, and the farmer's wife.

How We Grow Old.

A broken toy: a task that held away
A yearning child-heart from an hour of play;
A Christmas that no Christmas idols brought;
A tangled lesson, full of tingled thought;
A homesick boy: a senior gowned and wise;
A glimpse of life, when lo! the curtains rise
Fold over fold,
And hangs the picture, like a boundless sea—
The world, all action and reality—
So we grow old.

A wedding, and a tender wife's caress;
A prattling babe the parents' life to bless;
A home of joys and cares in equal part;
A dreary watching with a heavy heart;
And Death a drear angel knocking at the gate,
And Hope and Courage bidding Sorrow wait
Or loose her hold;
A new wands gone, and then a brave return
To where the fires of life triumphant burn—
So we grow old.

A fortune and a gen'rous meed of fame,
Or direful ruin and a tarnished name,
A slipping off of week and month and year,
Faster and faster as the close draws near:
A grief to-day, and with to-morrow's light
A pleasure that transforms the sullen night
From lead to gold;
A chilling Winter of unchanging storm;
A Spring replete with dawns and sunsets warm,
So we grow old.

Old to ourselves, but children yet to be
In the strange cities of eternity.

—[N. Y. Evening Post.

SAYS the Ventura *Signal:* A man in Santa Clara valley, on the Briggs ranch, two yeaas ago bonght $2,000 worth of hogs, and has sold from the increase $12,000 worth and has $8,000 worth of hogs on haud. Another party of the same ranch commenced with fifty hogs and kept a strict account of all the expenses of keeping the hogs, and of all that he had sold during the year. At the end of the year, with what he had sold and stock on hand, he had over three hundred dollars clear of every dollar invested. Who will say this is not a good country for hog raising?

The Vineyard.

GRAPE CULTURE.

GRAPE culture may be looked upon in California as an established industry, as much so as cotton is in the Southern States. There is no question as to the superior size, beauty and excellence of California grapes, and the fine growth and healthfulness of the vines. There is a question as to what varieties to plant, and for what purpose, to insure the greatest profits. This question may be settled in the minds of some, but deserves to be better understood by the masses. It is certain that wine making in California has not, as yet, proved very remunerative, and many thousands of gallons of the wines in casks to-day would not bring as much as the casks are worth, and many holders of wine vineyards are bankrupt, or have their property heavily mortgaged.

There may be some particular varieties of grapes that will, in some special localities, make what is called "choice wines," and readily sell at paying prices. But so far, at least, this has proved the exception. Fine varieties of table grapes grown in favorable localities near easy transportation to markets have invariably paid well, and in many instances have made owners of small vineyards independent. We know of a number of owners of vineyards who have grafted their so-called wire grape vines to table and raisin grapes with satisfactory results. Every season the demand right at home for eating grapes is increasing, and during a season like the present one when the rains have held off, and the season has been prolonged to Christmas, there are hardly enough to supply the demand at reasonable prices.

Shipping fresh grapes East must continue to be a growing business for many years, as under our genial suns we can produce earlier and finer grapes than will grow out of doors in the rainy and uncertain climate east of the Rocky Mountains; but for permanent and reliable profits, the raisin grape, in suitable localities for early maturing and ready curing, must prove the best. The best raisin districts appear to be far enough inland to be beyond the chilly sea air, which tends to retard ripening, and upon deep, fine soils, such as are favorable to the production of large as well as sweet grapes. The very driest and hottest portions of our State will make very sweet grapes, but they are likely to be quite small unless the vines are irrigated. The regions along the coast where the sea air affects them, produce beautiful large grapes, but they lack the sweetness for raisins, and ripen two weeks to two months later. While they are fine for market, and come after the rush from interior vineyards is over, and bring fair prices for the table, they are not as suitable for raisins.

There is a raisin belt, so to speak, occupying a medium climate between the extreme heat of the interior and eastern portions of the Sacramento and San Joaquin valleys, for instance, and the coast counties; a portion of country where the climate is so tempered and softened by a commingling of dry heat and damp sea breezes as to produce large, luscious fruit, and ripen them, and cure them in good season.

The mountain region above the hot valleys and below the snow line, all along the Sierras, and some other ranges of mountains, will prove excellent raisin regions. It would not be difficult for an experienced culturist, who has a fund of observations as data, to determine at once a suitable location for a successful raisin vineyard. We do not pretend that raisins cannot be made in any locality where grapes will grow, but simply that there are localities as to soil and climate naturally best adapted to raisin culture. In sheltered spots near the sea, and by irrigation in dry, hot districts, good raisins can be produced and the business of making them will pay.

To any one desiring to engage in grape culture we unhesitatingly advise the business of raisin growing as the branch that promises the best pay and most permanent prosperity. It has already been made a success, and there is a splendid prospect for it in the future. There is absolutely an unlimited demand for the product, for many years to come, and it is fair to presume that were the present supply met, that an increasing demand would justify doubling it within a few years.

This has been the case with other fruits within our memory and yearly the demand for table use of all nutritious fruits is increasing.

Of all fruits there is none more luscious and nutritious than the grape. It comes nearer being a perfect fruit for the sustenance of man than any other one. Men and animals can live and thrive upon grapes or raisins alone, without other food. It is attractive to the eye, acceptable to the palate, and satisfying to the appetite. Made a good use of it is a real blessing to the world. But where is there a surer stepping stone to woe than the sparkling wine which entices by exhilerating nectar, and its promise of joy, only to deceive and to disappoint, and at last to sting like an adder, leaving a depth of appetite craving for stronger drink which cannot be quenched, but only leads nearer to destruction and death. Were it simply a poison it were better, but it not alone kills, it demoralizes its victim, makes him a demon, to despise himself, hate mankind, and abuse his best and only friends, often with curses and blows. Wine is not a product of growth, but of decay. Alcohol is the product of rottenness, and its touch is pollution.

We do not regret there is so little profit in the wine making and liquor part of the business, and are thankful that the better uses of the grape does pay, both in material prosperity to the whole people and to the producer. Old vineyards can be grafted with raisin and table varieties, and the second year they will bear fine crops of fruit.

It is not a very great job to plant a vineyard in California. No deep digging and handling of the soil is necessary. The land should be laid out in rows, some seven or eight feet apart, both ways. This may be done by furrowing both lines with a plow. Cuttings eighteen inches or two feet long are as good as rooted vines to plant, and where the furrows cross a man with a strong, long-handled spade can remove the earth the depth of the blade below the furrow and put the cutting in slanting, pressing it in firmly, leaving one or two buds above the surface. In a day, two men can easily plant a thousand cuttings in good shape. A stake should be stuck by each plant to show where it is, and to tie the shoot to when it grows. Thorough surface cultivation to keep the surface clean of weeds, and light and loose, will be all that is necessary the first season.

VARIETIES OF RAISIN GRAPES.

The White Muscat of Alexandria is the best raisin grape known. The only objection to it is large seeds and thick skin.

The Muscatel Gordo Blanco, (White Muscatel,) is large sized, with thin skin and small seeds—a good raisin grape, but light bearer.

The White Malaga is also a good raisin grape, nearly the same as, (some say identical with,) the Muscat of Alexandria—has small seeds.

The Uva Larga is a long white grape of the Muscatel family,—good in localities removed from the coast.

The Fiber Zagos is not fit for raisins near the sea coast, but in the hot interior will do fairly, making a small, delicate raisin.

The Cannon Hall Muscat is so near like the White Muscat of Alexandria that it might be taken for it. A large grape, will do well in rich, moist soils, in warm localities.

The Sultana, (seedless raisin,) grape is small, but quite a favorite in choice localities near the coast.

The Zante Currant or Corinth varieties do splendidly in California. The Zante Imported Currants, (so called,) are made from the se. Every vineyard should have a few vines of black and white Corinth grapes. We believe a vineyard devoted exclusively to them would pay well.

Of table varieties the Black Hamburg, Rose Peru, Flame Tokay, and Verdel are excellent and beautiful varieties, and should be planted as leading sorts. Several of the so-called wine grapes are good for table use, but most of them are in some way objectionable.

On rich, dark soils the vines grow much stronger than on light soils, and should be planted farther apart. Also on moist soils, where there is danger of mildewing, the vines should be trained higher than on dry soils, and when in bearing the vines should be allowed to dry out in sun and wind.

GRAPE SUGAR AND SYRUP.

Experiments in making grape syrup and even good sugar, have been quite successful during the last season, and this branch of grape culture promises to be one of considerable importance. Three years ago a five-gallon keg of grape syrup was sent to us from Butte county. It was of good quality, and a sample of it kept good nearly three years, and until used up, exposed during the time to changes of heat and cold.

Bees will fill their hives with a good quality of honey from grapes that have been picked by birds and broken into by yellow jackets, but they are powerless to injure whole fruit. Grapes grown in dry, hot localities, are rich in saccharine properties, and produce a large percentage of syrup and sugar.

Sugar makers and scientists have often pronounced it impossible to make a good quality of sugar from fruits which also contain an acid, as the acid cannot be neutralized without destroying the sugar. But we believe there is a difference in sugars of this character and the down grade grape sugars extracted from other substances, and that a process of refining and granulating grape sugar, or sugar of gapes, will soon be discovered. Should such be the case, sugar making from grapes will some time be a grand industry. The nearer to perfection of maturity and ripening a grape gets, the more sugar and less acid it contains; so by still further completing the natural process of ripening by artificial means the sugar attains a high degree of perfection.

The acid in common grape fruit sugar prevents granulation, but it is healthful, and for many domestic purposes is equally as good as cane, or pure sweet sugars. A process that will perfect the sugar of grapes will make the discoverer independently rich, and also enrich the growers, and largely benefit the country and the world. But even a good common quality of sugar and syrup, from grape fruit, will pay, and we are glad to see it becoming a permanent industry.

RAISINS IN STORE.

There are at present about eighty tons of fine California raisins in the storerooms of the Grangers' Business Association, at San Francisco. Upwards of forty-five tons were put up by S. K. Chandler, of Yuba City, Sutter Co., and the remainder by various parties in the southern counties, and elsewhere.

RAISIN GRAPES.—Among other productions of this valley that doubtless will attract much attention in the future, is the raisin grape. That the cultivating of this grape in this county is a success, is known by actual experiment. Raisins produced in this county were sent to New York city last year, which were pronounced the best raisins that had ever been in that market. Why should we let other countries grow rich from a production when we can produce a superior kind. Much money is paid, not only from other States, but also from this State to other countries and the island trade annually for raisins, when we have every facility for producing the same, of a better quality, at home. We are glad to see that some of our citizens are taking an interest in this respect and starting vineyards of the regular raisin grape. When agriculture is brought to a higher standard this will be a source of much wealth.—*Tulare Times.*

RAISIN MAKING is no longer an experiment in this State. That good raisins can be made here, and that the business can be made to pay well, is fully settled, and California raisins are already a standard commercial article. Nor does it require any great outlay of money to prepare for raisin making. The preparation is within the means of the smallest grower, and the process is simple and easily learned, and may be carried on in a small way just as successfully as on a larger scale. Indeed, the small operators generally succeed the best, as they generally give to the business their immediate care and attention, and care and attention are the principal requisites to success, the proper variety of grapes being possessed. In all raisin making countries nature furnishes the necessary heat, while man provides the means of exposure of the fruit in such a way as to secure the heat in the most effective manner.—*Record-Union.*

THE CONSUMPTION OF RAISINS in this State is estimated at from 15,000 to 18,000 boxes. If this estimate be correct, there will be a surplus of from 2,000 to 5,000 boxes from this year's crop for export. The cost of production and marketing the native raisin is about as follows:

Three pounds of Grapes to one of Raisins, at 2 cents	6c
Cost of curing and packing	1c
Boxes	1c
Freight to and handling at San Francisco	1c
Freight overland, in Greenbacks, 1¾, and commissions East	2c

Thus the total cost of curing and placing California raisins in the markets of the East does not exceed 11 cents per pound.—*S. F. Bulletin.*

THE RAISINS produced in our State are meeting with great favor in the Eastern States, and have been pronounced by a convention of leading dealers to be full weight and superior in quality to the imported Malagas.

Sheep and Goats.

History of the Angora Goat in the United States.

BY R. PETERS, ESQ., ATLANTA, GA.

[From the American Agriculturist.]

INTRODUCTION INTO THE UNITED STATES.

DURING the administration of President Polk, the Sultan of Turkey requested that a suitable person be sent to that country to experiment in the culture of cotton. Dr. Jas. B. Davis, of South Carolina, was selected and commissioned to perform this important service. On his return, in 1848, the Sultan, desiring to reciprocate the courtesy of the President, caused nine head of the choicest fleece-bearing goats in his dominions, to be selected and presented to Dr. Davis. These doubtless were selected from the herds of Angora, a district of country lying among the Taurus Mountains, which traverse Asiatic Turkey, and which derives its name from its principal city, situated about two hundred miles east of Constantinople. In 1854 I visited the farm of Dr. Davis, near Columbia, S. C., and found his stock of pure-bred Angoras, (these goats are called by the Arabs *Chamal*, or Camel-goat, meaning "soft," or "silky,") to consist of seven females and two males. Besides these he had one pure-bred Thibet ewe, several head of one-half Thibet and one-half Angora, and quite a number of grade females, bred from the common short haired ewe goats of the country, and his Angora bucks. I purchased all the pure-bred Angoras, and several of the Thibet-Angoras. Dr. Davis had fallen into error as to the native country of his goats; and and believing them to be *Cashmere*, quoted their fleeces as being worth from six to eight dollars per pound, while in reality they were Angoras, whose fleece, known to commerce as "mohair," has been an article of import into Great Britain and this country for years, and held at from sixty cents to one dollar per pound.

CHARACTERISTICS AND HABITS.

I have owned Angoras selected from six distinct importations from Asia, and have found them to differ greatly in size, fleece, and horns, and the shape of the ears. It is easy to trace several varieties of crosses in many of the importations, occasioned, doubtless, by the fact that stock-breeders, in their native country, are ignorant of the system prevailing here, of breeding up from point to point, and more generally to the admission of stray bucks from distant localities into the various flocks. In fact, it may be safely asserted that we have in this country, any quantity of grade goats far superior to many that have been imported. In the absence of any other standard than that suggested by my own judgment, founded on my experience with these valuable animals, I have for twenty years observed the following rules in selecting a stock buck. 1st. Pedigree dating back to ancestors imported from Asia. 2d. Weight and length of the long, silky, ringletted, white fleece, and its freedom from kemp and mane on the back and neck. 3d. Form, size, and vigor. 4th. Long, pendent ears, and upright, spiral horns.

By a persevering and studious adherence to this system of selection, I have obtained a flock of great uniformity. The Angora is a hardy, industrious, and nearly self-sustaining animal—subsists in its Asiatic mountain home almost-entirely by browsing—and may be classed as herbivorous. Being active and vigorons, they roam over wide ranges of wild, rugged country, in search of food, utilizing and giving value to worthless vegetation, refused by most other animals, and will feed and fatten double the distance from water that sheep can, as they travel much faster, and can endure more. The Angora seems not to succeed well in the Middle and Eastern States, where they are imprisoned (as it were) in small enclosures, and kept on grass in summer, and in closed barns in winter. Although from a locality on the fortieth parallel of latitude, north, they thrive best below that line on the Atlantic coast, though they do surprisingly well on the Pacific coast, as far as introduced, but especially in California, New Mexico, Colorado, and Arizona, whose climate and topography is said to closely resemble that of their Asiatic home, with its wet and dry seasons. It cannot brook—scarcely endure—confinement, but loves to roam at will over the highest mountain peaks, thriving and yielding its rapid increase of progeny, and its ringletted, silky fleece, where other stock will starve. It is a singular fact that while the Angora will live in the snow all winter, in the southern latitudes, and do well on browse, they will die in a northern latitude, housed and fed, or in a very wet climate. Efforts have been made to acclimate them in England, and signally failed; while in France, after an expenditure of $350,000, they are likely to succeed in but one locality of limited extent. If not sooner sheared, the Angoras shed their overcoat of "mohair," in March or April of each year. Their winter coating then grows slowly until about July, when the "mohair" starts and grows very rapidly, until January, when it gains its full growth, averaging about nine inches in length. The Angoras live to a greater age than Merino sheep, and are more prolific. I have three ewes in my flock, numbered by the Randall system of notches in the ears, so there can be no mistake as to their identity. No. 53 was dropped in 1861. She has raised 21 kids, brought her first in 1862, and her last in 1875, is now very feeble and on the decline. No. 68 was dropped in 1863, and No. 69 in 1863, both brought fine kids in March, 1876, at the age of 14 and 13 years.

AVERAGE ANNUAL CLIP.

Pure-bred Angoras will yield from five to eight pounds of "mohair" per clip, with one notable exception of a ten-pound clip from a celebrated no-horned Costanboul buck, the property of Mr. Landrum, of California. The general uniformity of the yield is is indicated by the fact that in 1854 I sheared six and a-half pounds of "mohair" from a buck of the Davis importation, referred to above, and in 1876 I sheared exactly the same quantity from one of his descendants.

VALUE OF THE FLEECE.

The market value of mohair, like all other commercial commodities, may be expected to fluctuate in accordance with the laws of supply and demand. But as the production is now, and for many years must continue to be unequal to the demand, prices must remain at, or approximate those now current. In the meantime improvement may reasonably be expected in the yield, the quality, and its preparation for market, at an inappreciable increase of cost. I have already quoted it at from 60 cents to one dollar per pound. But the shrinkage in all values within the last twelve months, has affected "mohair" also. As to present [August] prices the following returns of a small shipment to the Jamestown, N. Y., Manufacturing Company are respectfully presented:

JAMESTOWN ALPACA MILLS,
Jamestown, N. Y., July 18th, 1876.

RICHARD PETERS, Atlanta, Ga.,

Sold To HALL & TURNER,

(Mohairs, Alpacas, Poplins and Worsteds)

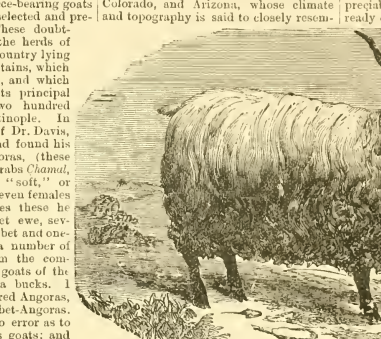
10 lbs. 3d	do	do	@ 55c.....	5.50
7 lbs. black	do	do	@ 45c.....	3 85
43 lbs. ¾ grade	do	do	@ 20c.....	8.60

USES OF ANGORA GOAT PRODUCTS.

"Mohair," the commercial name of the fleece of the Angora goat, is used for the manufactures of which wool may form a part—but its length, great strength, and silkiness of fiber, and its beautiful luster, and the fact that it readily receives dyes, which, once set, are indelible, gives it a higher market value, accompanied by a rapidly increasing demand. It is manufactured principally into poplins and alpaca goods, that are known as mohair goods, and into plushes and braids.

In California and other of the Pacific States, large flocks of grade Angoras are being bred for their skins, for which there is an increasing demand at San Jose, California, by the Angora Robe, Glove and Mat Manufactory. The carcass is highly prized, wherever introduced, as food, while the milk is highly esteemed for domestic use and the sick room. Taken altogether, the Angora may be regarded as a very valuable acquisition, and an addition to the resources of our husbandry—especially in the Middle, South Atlantic, Western and Pacific States. The great hardiness and beauty of the animal, its almost entire freedom from disease, its self-sustaining qualities, and the rapidity with which it multiplies itself and grows, must make it a universal favorite.



THE FEMALE ANGORA GOAT.

CAN IT BE CROSSED WITH SHEEP?

Prior to the year 1860 I tried many experiments, in hopes of obtaining a cross between the goat and sheep, and failed in every instance. Extensive correspondence with other breeders has convinced me that the cross cannot be obtained. Dr. John Bachman, the celebrated naturalist of Charleston, S. C., who was in correspondence with the most distinguished naturalists of Europe, informed me that he had no faith in the theory, and did not believe the cross obtainable. He stated, however, that Cuvier, the renowned French naturalist, claimed to have examined a specimen of such a hybrid, but Dr. Bachman himself believed that Cuvier had been deceived, or had made a mistake.

INTRODUCTION INTO CALIFORNIA.

In the spring of 1861 I shipped, by Adams Express, to St. Louis, two 16-months'-old bucks to Mr. Wm. M. Landrum, then of Joaquin county, California, who, at the ensuing State Fair, in September, received a special premium for the introduction of the Angora, or "Cashmere" goat—a large size silver goblet. From St. Louis they were transported by steamer to Fort Leavenworth. Thence they traveled on foot with the wagon train, browsing on what was rejected by other animals, and arrived uninjured, and in good condition, at their new home. One died of snake-bite, after siring about thirty kids. The other, widely and popularly known on the Pacific Coast as "Billy Atlanta," and "King of the Cashmere Goats,") lived to be ten years old, (when he was accidentally killed,) and sired about 2,000 kids. This buck won the sweepstake prize, against all competion, at every fair down to that preceding his death; his numerous descendants are scattered all along the Pacific Coast, and his blood courses in the veins of over one-half the Angora flocks in the several grades, in that part of the Union, estimated to approximate 70,000 head.

In November, 1867, Mr. Landrum imported eight head, and these were followed in December by seven imported by Gray & Gilmore; and these by three imported by Mr. Flint. In 1868 Gray & Gilmore imported seven more, and Messrs. Landrum, Butterfield & Son imported two bucks—one of which was the celebrated no-horned Costamboul already mentioned. Soon after, in the same year, (1868,) I sent out 25 head of choice pure-bred goats by Mr. E. Holland, of Atlanta, 17 of which were bought by Landrum, Butterfield & Son, and the other eight by various parties in California.

In 1870 Diehl & Brown shipped ont most of their stock, 60 of which survived, and passed into the hands of Butterfield & Son. In 1871-72, Shearland & Thomas imported the larger portion of the Eutychides flock, and in 1872 Landrum & Rogers bought the greater portion of my pure-bred stock. Thus it will be observed that about one-third of the pure-breds introduced into California, was contributed from the first and original (Davis) importation of 1848; and that its blood is present in probably two-thirds or three-fourths of the Angora stock on the Pacific Coast.

SUGGESTIONS AS TO FUTURE IMPORTATIONS.

As already intimated, the importation of Asiatic goats has been promiscuous,

and in many cases from chance lots of ill-bred, ill-assorted stock. Few have been imported direct from their native mountain country; the greater portion having been purchased near the coast by persons unacquainted with the business, and more interested in speculation, than regard for, or a desire to improve the stock. Mr. John M. Harris, of California, is an exception, he having, last year, visited both Casemere and Angora, and after observation and inquiry, decided in favor of the last named as the best adapted to this country. He purchased and imported two bucks and ten ewes, (all yearlings,) which, with their increase on the way, cost him at the time of landing over five hundred dollars each.

To obtain the finest specimens of pure-bred Angoras, I am clearly of opinion that some experienced breeder should go direct to the native home of the goat and remain one or more years, select and breed there, and thus by securing an improved stock, obtain animals which would be a decided improvement on many of the previous importations, and prove a really valuable addition to our Angora stock.

THE GOAT OF THIBET THE TRUE CASHMERE.

The name "Cashmere" is derived from that of the city where the far-famed Cashmere shawl is made, but the wool entering into its manufacture is obtained from the *undercoat* of the goat of Thibet —the home of which goat is among and between the principal and secondary ranges of the Himalayas, near the regions of perpetual snow, from 10,000 to 22,000 feet above the ocean, distant northwesterly about 1,500 miles from Calcutta, and 2,500 miles east of Angora.

Dr. Davis brought with him from Asia, in 1848, besides the Angoras, a pair of Thibet goats. The male died soon after his arrival in this country. The female was smaller than Angoras, narrow in the chest, with fox-ears, and rather short, upright, spiral horns. She had an undercoat of downy wool, and an overcoat of white hair about four inches long. This undercoat is combed out by the natives as it starts to shed in the spring, and is used by them in the manufacture of the Cashmere shawls.

In 1859 I bought a male Thibet goat, and three females having the appearance of being half Thibet and half Angora. The Thibet male bore a strong resemblance to the Thibet female imported by Dr. Davis. I combed out his undercoat of wool early in April, 1859, but could make no practical use of it.

In 1854, when about to invest in Thibet and Angora goats, I was advised by Dr. Bachman not to purchase the Thibet goats, but to rely on the Angoras, as, in his opinion, the Thibet goats, like the Llamas of the Andes, could not be successfully acclimated in a locality under 10,000 feet above the ocean. His opinion proved to be correct in my case, as all the Thibet goats in my flock, pure and graded, died in a few years after I purchased them, from a disease of the lungs combined with dysentery, and I have heard of no one having been successful in the United States east of the Rocky Mountains, with the Thibets or Llamas. I am inclined to believe, however, that with care and attention, both can be acclimated and profitably bred on the elevated plateaus of California, Colorado, and New Mexico, and perhaps other portions of that highly favored portion of the Union.

THERE are six bearing orange trees in Marysville within a distance of two blocks. They range from 50 to 100 to the tree.

Forest Culture.

Fallen Leaves.

The wintry breeze disrobes the trees
And leaves them sad and cheerless,
Whose lean arms dread no alarms,
Like giants bold and fearless.
The withering blast comes rushing past
And grasps the leaves in cold embrace,
Till on the ground the glow is found—
Their beauty perished in its place.
The summer flew and autumn too,
Then chilly night and morning,
Came down amain, with ice-cold rain,
And snow them without warning.
They trembling pass across the grass,
Or on the path of gravel,—
Making a bed soft to the tread,
Where children like to revel.
The rustling noise delights the boys,
Who are in but life's dawning;
While from the trees by slow degrees,
Come signs of death-like warning.
Like flocks of quail, are they sail,
A whirling, golden column,
Leaving all pale to meet the gale,
The maples bare and solemn.
They pile the ground in heaps around;
I hear in walking through them,
A wrestling voice, as'if they called
To one who loved and knew them.

FORESTRY.

MAN, in an uncivilized and in a half civilized condition, depends upon the wild forests that nature in some localities has bestowed with a lavish hand, for all the fuel and timber that he has found it necessary or convenient to use. As civilization has advanced and population increased, the increased demand for timber in many industrial directions have denuded vast tracts of land of timber trees, and caused a scarcity while the demand has proportionately increased. Other vast tracts of land, rich in soil and productive capacity, but naturally destitute of timber or other trees, have become settled up and cultivated to food-producing plants, to stock raising, etc., still further increasing the demand for timber.

Forest culture has not kept pace with this demand, nor has it met with the encouragement nor been given the attention that it deserves. In this respect our civilization seems not in a very advanced state to-day. To be sure iron, and some other materials, have supplanted and taken the place of wood in the manufacture of many implements, and in uses where, were wood more abundant and cheap, it would have retained its supremacy. But certain it is that this branch of culture has not attained to the influence in the general estimate of farmers that it deserves. There is great need of this subject being often discussed, and constantly kept before the public, that the masses may be educated, as it were, to a realization of its importance in our domestic economy, and of its sure return of profit to the cultivator. Also our farmers, who are generally ignorant upon the subject of propagation and culture of the different kinds of the valuable forest trees need to be instructed therein, and many of them really desire a complete knowledge upon this subject, and would venture upon the same as a diversion at least, had they the requisite information and data upon which to make a beginning.

It is in the beginning that knowledge and care of tree culture is especially required. Once started, and two or three years grown, and but little knowledge would be needed, and no more care than any person of ordinary intelligence could give. Our nurserymen would confer a favor upon the public by giving, through our columns, directions for planting seeds and cuttings of forest trees, and how to cultivate until the trees are established in the soil. They would also do well to keep a stock of such material in the way of seeds and cheap seedlings as are best to plant for forests. Trees that have been grown two or three years in the nursery are generally held at too high prices to plant for a forest and are not so fit for the purpose as trees not over six months or one year in the seed bed, while some kinds are better planted at once where they are to grow. The best arrangement that the farmers of any section could make would be to co-operate together to start forests employing a suitable person to oversee the whole, to start seedlings and cuttings by the wholesale, under favorable conditions, and apportion them to planters.

One man could start and care for the stock of seedlings and young trees for twenty or more farmers, and his wages divided among so many would be but a trifle to each. But as our farmers and communities are generally as backward in co-operative movements as they are in tree planting, we fear that this advice, however rational it may be regarded, will fall upon poor soil and be lost. A higher civilization that will exclude some of the selfishness and indifference that neighbors usually hold towards each other must first be cultivated before men will associate together in many economical ways to their individual and social advantages.

Leading the question of "how to grow a forest," is the all important one, "is there money in it?" Statistics upon this point are already abundant and conclusive. It will pay any farmer to cultivate a few acres of forest and in many localities the soil can be put to no more remunerative use.

The best sorts and varieties of trees to cultivate for timber and fuel is another important matter. Of course this will largely depend upon the soil, climate, and demand for special classes of timber. The same judgment is required in this regard as in any other branch of culture upon the farm. There is always a best kind of everything, best suited to localities and conditions, and it takes a good farmer to always know what is best. But it is safe to plant out a variety, and as the trees grow, extend the culture of such as prove the best adapted to your locality. Almost any kind of a tree is better than none, and will pay for culture.

The conditions favorable to the growth of seeds and young trees are light soil—either naturally light or made so by cultivation—moisture, and a surface shelter of mulching composed of leaves or strawy manure. Forest tree seeds of all kinds are best sprouted in beds before planting, and some kinds should be allowed to grow in beds a whole season and then be transplanted.

The seeds of nut bearing trees, such as pecans, walnuts and acorns, should be sprouted in compost beds of sand and half decomposed leaves or rotted straw. When the sprouts are an inch long the nuts should each be carefully planted where they are to grow, in a shovelfull of the same compost. The sprouted seeds must be carefully handled and transplanted by hand, pressing the soil firmly about it, and covering with mulch or compost only. The ground can be laid out with furrows the same as for potatoes or corn, with crosss furrows, planting the seeds where the furrows cross, thus insuring straight lines and equal distances for convenience in cultivating. The trees of this species send down deep tap roots the first season, and will grow in quite dry soil, but better in moist. No weeds should be allowed to grow among them to absorb away the moisture, but the surface should be kept light to retain it. Trees of the maple family should be grown one year in seed beds, made of rich earth, sand and decomposed vegetable matter, thoroughly spaded together, and then be transplanted where they are to grow. The willow and cottonwood family can be grown from cuttings as well as from seeds. These may be planted at once where they are to grow if the soil is irrigated or quite moist, or they may be grown a year or two in nursery.

Evergreens, such as pines, cypresses, firs, spruces, etc., are best started from seeds in seed beds, or boxes, and grown a few months, or a whole year, before they are planted out in forest. They may be grown in nursery a year or two and then be transplanted, but this would require extra labor. The same may be said of the eucalyptus and other evergreens.

Where the soil can be irrigated vegetables may be grown on the same ground a year or two, until the trees get large enough to occupy the ground.

A forest should be planted out a good deal closer than the trees are expected to stand. We would plant the trees not over four feet apart. In a few years when they get crowded and want more room, remove every other one, and so on, until the requisite size and distance is attained. Several sorts of trees may be planted together, for the purpose of removing a portion of them at different ages for fuel, fence poles, posts timber, etc., leaving at last whatever trees were preferred."

Trees growing pretty closely together make straighter trunks and are clearer of large limbs, such as would injure for timber. Trees growing in the wild forests in our climate are so deeply rooted that it almost impossible to remove them with success for transplanting, and it is better to depend upon growing them from the seed or cuttings. In the East, where the roots are kept near the surface by a shallow soil and much moisture, the case is somewhat different. Our nurserymen in this State have to irrigate to keep the root growth near enough to the surface to make the removal of the trees with good roots and with ease possible.

These few suggestions we offer as a preliminary to much that we propose to publish on this subject in future numbers of this journal.

The Value of Forest Trees for a Shelter.

No farm can be considered complete without at least a shelter of trees; enough to break the winds and furnish fuel and timber for home consumption. The *Western Advertiser* says:

"We have often urged the wisdom of having a grove at the rear of the farmhouse to shelter the back premises and protect the outbuildings from storms. The other day we saw our ideal in this respect realized. A farmer in Nassageweya has had the good sense to reserve about an acre of wood-land, mostly second growth, at the rear of his dwelling-house. It consists partly of deciduous and partly of evergreen trees, and even at this season of the year has a cosy, comfortable look. Here the chickens wander about, and here the children play. A soap-leach, oven, and various domestic conveniences are partially hidden and sheltered. The best of all is the complete protection afforded from the cold northwestern winds. Both the stock and the human beings on the place will feel the good of this during the cold season of the year."

The *Country Gentleman* says that "Smith & Powell of Syracuse have for many years employed evergreen screens on a portion of their nursery grounds to much advantage. Plants on the lee side of a screen thirty feet high, are visibly benefitted by the protection to a distance of forty or fifty rods, and more distinctly for twenty rods. In one instance, a fifteen acre wheat field thus protected bore an excellent and even crop; while in another field exposed to the sweep of winds, it was killed in patches, and, as was estimated, yielded only one-half as much as on the sheltered land. Grass near the screen furnishes earlier pasturage than on the exposed surfaces."

Mr. C. S. Abbott, of Salinas, uttered the following on this subject in an address before the Agricultural Association of his county last fall: "The subject of shelter has not been sufficiently considered or discussed in this country. When you cut down a large piece of woodland, you change the climate of the tract of land which has been sheltered by it from the force of the prevailing winds. When you clothe a piece of land with timber, you make a milder climate for the land lying to leeward and sheltered by it. Who has not observed that the vegetation was much the rankest on the lee-side of a fence, as our winds in summer time always blow in the same direction? Instead of a fence, suppose a belt of gum trees, (say twenty or thirty feet wide) were planted across the valley every half mile, which in ten or fifteen years would be from 60 to 100 feet high. This would not only furnish fuel for the entire population, but would entirely break the raw coast winds from the valley. Then the light showers that fall during the night at the close of the rainy season would have the desired effect on the growing crops instead of being licked up by ten o'clock the next morning by a gale from the northwest. The roots of the trees would strike deep into the soil, sap the moisture from the earth and diffuse all through the pores of the earth into the atmosphere. A large percentage of the tree itself is water; moisture attracts moisture, hence it is more likely to rain in timbered countries than on arid plains. Take for example the amount of rainfall from Cape St. Lucas to Puget Sound, and you will find that it varies from sixty inches to nothing, according to the density of the foliage."

The Stockton *Independent* says: "There is every reason and argument in favor of, and no objection against it. If cordons of trees a few miles apart were planted across the valley, a perfect barrier and wind-break would be formed, to prevent the disastrous results that are frequently felt in the grainfields from the drying, withering, scorching north winds that come in that critical period when the young grain is in milk and before it has reached a safe maturity. A single year's loss in grain in this valley from the effects of the north wind would be sufficient to plant all the trees that could be induced to live for years to come. The lack of firewood is another inducement to tree-planting, and the shade that they would give to stock would go far to alleviate their sufferings in the heated term, when the valley is like a fiery furnace. Trees plentifully and systematically planted would also effect such a change in the climate of the valley that its barrenness would be transformed to fruitfulness, and moisture would be retained in the soil throughout the year. The present is the most favorable season of the year for tree planting, and its prosecution should be given every encouragement. Large areas in France have lately been planted with forest trees on tracts of land that have become unfruitful for other purposes, and it is said that they are flourishing finely. It is said that 5,000,000 hectares, or 12,350,000 acres—about one-half the area of Ohio—have become unproductive as agricultural lands. Pine trees, without any cultivation and a very inexpensive supervision, can be made to grow upon these barren acres, netting about $30,000,000 per annum. Other trees have been planted with similar economic results, and now landed proprietors are looking to tree planting as a means of utilizing their unproductive acres."

THE EUCALYPTUS.

The Eucalyptus, or Australian gum tree, is so well and favorably known in California, that little need be said in its favor. It is bound to be the forest tree on this coast, owing to its rapid growth, tall, straight trunk, strength and elasticity of timber, value as fuel, and general usefulness as timber. For the first ten years of growth, the blue gum will average ten feet a year, or 100 feet high in ten years, when grown on deep, rich, moist soils, and it will grow very fairly on dry soil. Here is a description of the four principal and most valuable varieties of this tree, as given by Baron Ferdinand Von Mueller, of Australia:

EUCALYPTUS GLOBULUS.

(Blue-gum tree of Victoria and Tasmania)—This tree is of extremely rapid growth, and attains a hight of four hundred feet, furnishing a first-class wood. Shipbuilders get keels of this timber 120 feet long; they also use it extensively for planking and other parts of the ship.

It is considered superior to American Rock Elm. A test of strength made between some blue-gum, English oak and Indian teak, showed that the blue gum carried 14 pounds weight more than than the oak and 17 pounds 4 ounces more than teak upon the square inch. It is extensively used by carpenters for all all kinds of out-door work, for fence rails, shafts and spokes of drays, and a variety of other purposes.

For railway sleepers it lasts about nine years. The wood is of a yellowish grey tint, with a close, straight grain. The seeds are extremely minute, an ounce containing several thousands. As an absorbent or neutralizer of malaria the Eucalyptus Globuls is believed to possess remarkable qualities. Pestiferous swamps in Algiers and other countries have been planted with it and have become healthy localities.

Through the efforts of the Italian Patriot, General Garabaldi, the deadly Campagna, near Rome, is about to be planted with Australian blue gum.

EUCALYPTUS ROSTRATA.

(The red gum-tree of Victoria, South Australia, and many river flats in the interior of the Australian Continent.)—It is a hard, dense wood with a handsome, curly, but rather short grain. It is almost entirely free from the tendency to longitudinal shrinkage which is the invariable characteristic of all the other varieties of Eucalyptus. It is of extraordinary endurance underground, and therefore, highly valued for fence-posts, piles and railway sleepers. It is extensively used by shipbuilders for mainsterns, inner-posts, dead-wood, floor timbers, futtocks, transomes, knightheads, hawse-pieces, cant, stern, quarter, and fashion timber, windlass, bowrails, etc. It should be steamed before it is worked for planking. Next to the Jarrab, from western Australia, it is the best wood for resisting the attacks of the sea worms and white ants. Its possible uses are almost too various for enumeration, as an instance of which it may be mentioned that it is used with great advantage and economy for the bearings of machinery, the cost being almost nominal as compared with brass, whilst the material is equally serviceable and almost indestructible.

EUCALYPTUS AMYGDALINA:

(In the sheltered, springy forest glens of Victoria attaining not unfrequently a hight of over four hundred feet.) The wood splits easily and in a straight direction. It is well adapted for shingles, rails, house building, for the keelson and planking of ships, and for other purposes.

Seedlings raised on rather barren ground near Melbourne, have shown the same amazing rapidity of growth as those of the Eucalyptus Globulous, but not so easily satisfied with any soil. Baron Von Mueller notes a fallen tree of the Eucalyptus Amygdalina, which mensured 420 feet; one on the Black Spur, near Healsville, of 480 feet in hight; and another one of which the length of stem from the base to the first branch was 235 feet, girth of stem at three feet from the surface 41 feet, diameter of stem a first branch 4 feet, length of stem from first branch to where its top was broken off, 70; diameter of stem where broken off, 3 feet.

EUCALYPTUS SIDEROXYLON.

(Iron bark tree.)—It attains a hight of 100 feet, and affords a valuable timber, possessing great strength and hardness. It is largely employed by wagon builders, for wheels, poles, etc.; and is also used by turners, for rough work. It is considered the strongest wood in the Colony, and is extensively used in underground mining work.

The Forests of the World.

The forests of Europe are estsmated as being 500,000,000 acres in extent, or about 20 per cent. of the whole area of the continent. In North America it is reckoned that 1,460,000,000 acres are covered with trees, of which 900,000,000 are in British North America. In South America the forests occupy 700,000,000 acres. The total amount for the two continents of the New World and Europe gives 6,600,000,000 geographical miles. The proportion of forest land to the whole area of Europe, as above stated, is computed at 20 per cent.; in America 21 per cent. Supposing, therefore, 20 per cent. to be the proportion in Asia, Africa and Australia, the grand total of the forests of the world would cover a space of over 7,734,000,000 geographical miles. The areas of State forests and woodlands are estimated at the following figures in the following European countries: Prussia, 6,200,000 acres; Bavaria, 3,294,000 acres; France, 2,700,000 acres; Austria, 2,230,000 acres; Hanover, 900,000 acres; Wurtemburg, 469,007 acres; Saxony, 394,000 acres; England, 112,376 acres.

The range in the height of trees varies from the miniature alpine willows of a few inches in height to the stupendous Wellingtonia, which grows to the height of 350 feet, although it is stated that one of the eucalypti often reaches a height of 450 feet in Victoria. In Schavonia, a tree called the sapin attains a height of 275 feet, and the umbrella pines of Italy 200 feet. The California big tree is said to girth 96 feet.

The destruction of woods and forests, however, is very enormous, and in the majority of instances no attempts are being made for their reproduction. In South Africa, we are told, countless numbers of beautiful forest trees are destroyed and laid waste annually. In New Zealand the 30 per cent. of forests existing in 1830 had sank to 28 in 1867, and to 18 in 1873, which rate of reduction, if continued, would result in the total destruction of New Zealand forests by 1889. In America, in the United States especially, the consumption of timber is enormous, and although public attention has been called to the matter, and the United States statute of March, 1875, imposes a fine of $500 or a year's imprisonment for wanton injury or destruction of trees, and also a fine of $200 or six month's imprisonment for allowing cattle to injure trees "on national grounds," the yearly consumption and improvident use of timber is almost incredible.—*Land and Water.*

THE PECAN.

This is a variety of walnut, a native of the warmer portions of the United States, and flourishes in a natural condition on the alluvial soils along creeks and river bottoms. We have seen it growing in Texas in forests, as the oak grows in the Northern States, and have gathered bushels of the nuts. They are very rich—we think superior to any walnut. The trees produce abundantly and grow large. The timber is excellent for all purposes where ash and walnut are used. It is not so tough as the hickory, but is strong, elastic and serviceable. The tree is a rapid grower, soon attaining a size for use as timber. We are of the opinion that this is the most valuable nut and timber tree combined, that can be cultivated in California, and we desire to see it become popular and extensively cultivated. The following we quote from the *Prairie Farmer*, as it contains the sort of information most desirable:

THE COMING TIMBER TREE.

For several years I was casting about for a tree to plant for timber, for fuel, fencing, etc., upon the prairies; one that would be hardy, easily transplanted and of tolerably rapid growth. I watched with much interest experiments made by other parties having the same end in view, and felt equal disappointment with them at their ill success in obtaining the object of their search, namely, the best tree, all things considered, for the western prairie.

The cottonwood was hardy and of rapid growth, but worthless as a timber tree, and very inferior as fuel. The locust would sprout from the root so as to become a nuisance, and the borers ruined the groves. The gray willow did not realize the anticipations formed of it, even as a fencing material. The soft maple was valuable for wind-breaks and for fuel, but was not a timber tree. At this point I thought of the pecan (*Carya olivæformis*) a species of hickory, a native of the Illinois and Mississippi valleys. I satisfied myself, by experiment and investigation, of its value as a timber tree; wagon and carriage makers, wherever they had used it, testifying of its value as being equal to the best of white ash, for all purposes of buggy or carriage manufacture; possessing equal durability, and greater strength and elasticity. At various points on the Mississippi river, steamboat carpenters who had used it, found it a valuable timber in boat building. As a fuel it has no superior. But would it grow and thrive on our prairies?

To test this, in the fall of 1871 I dug up in the bottom land, along the Illinois river, a dozen or two young trees, heeled them in my garden for the winter, and in the spring removed them to my farm on

the prairie. The summer of 1872 was hot and dry, but all the trees grew and did finely. Next year I increased my planting, and thus far have three different settings of trees. I find it as easily transplanted as any tree I ever handled, having never lost a tree. Of vigorous growth, clean and healthy.

By my advice several of my friends have procured and planted this tree, and I have five hundred more which I intend to plant the coming spring.

The pecan tree ordinarily commences bearing at about eight years of age. It bears one of our finest nuts, which sold in the Cincinnati market, for the past six years, at an average price of five dollars per bushel.

A gentleman in the southern part of this State, who has a pecan orchard, partly natural, which he has increased by further planting, says "it is of more value to him yearly than his apple orchard."

The pecan tree is grown readily from the nut, if it is not allowed to become dry before planting. But to those who are so situated as to be able to procure thrifty young trees, of one or two years' growth, I would say get the trees. And to the farmer who is contemplating planting trees on the prairie for shade, for timber, nuts or fuel, or for an inheritance for his children, I would say plant the pecan, and future generations shall bless thee. L. Harrison.

Peoria, Ill.

German Forestry.—The aim of scientific forestry, in its present most advanced state, is to convert the regular growth of a woodland district into what is called a *geschlossener Bestand*, or compact forest; divided into distinct blocks of trees of equal age. The usual *Umtrieb*, or ortation, for beech, *Hochwald*, or high forest in Hanover, which may be taken as the model state, is 120 years. The forest is so divided that there shall be as nearly as possible six equal areas, allotted to as many periods of 20 years growth. Thus one block will be full of trees, not exceeding 20 years old; a second, trees from 20 to 40 years old, and so on. When a block arrives at the last periods felling commences by a *Vorbereitung* or preliminary clearing, which is little more than the ordinary thinning carried on from time to time in former periods. The beech in these woods only ripens its seed every third or fourth year. After the first seed year in the final period, a *Lichtschlag*, or clearing for light, takes place, in order to afford light for the germination of young seedlings; the finest trees being left standing. When the ground is well covered with seedlings the old trees are felled and carefully removed, and the block recommences growth. The tendency to a gradual removal of the old trees appears to be on the increase, so as to make the culture approach as nearly as possible to the natural growth of a wild forest.—*Edinburgh Review.*

Walnut Lumber.—Of all timber trees, the black walnut is at the present time believed to be most profitable. Prices have been so tempting that in many localities no more of any consequence are found. Ohio and Indiana have of late years been the great sources of supply. From these States large quantities have been sent to the furniture factories East. At the present time Kentucky is shipping walnut timber largely. While, however, the older States are being depleted of this valuable wood, the States that may be called timber-planting ones are rapidly coming up with a supply. It is found to grow with great rapidity in some of them, and especially in Nebraska. In this State several acres set out within the last ten years are already producing nuts in abundance, and these, it is said, have already paid the expense of planting and care. Many people, in view of the growing scarcity of walnut, fear its disappearance from market in a short time. It would be no matter for alarm if the extensive Western plantations were known. —*Forney's Weekly Press.*

The Eucalyptus in Algeria.—After successful plantings of this tree at Fondouk, Rouiba, and Hussein-dey, in Algeria, its culture was commenced on a large scarle in 1867. The first plantings have already produced wood that can be utilized in carpentry and wheel-wrighting. Planks over 40 feet long have been cut, showing that after eight years of growth this tree will produce timber of great value and utility. A proprietor, on his own account and for other parties, has, since 1867, planted about 200,000 trees of this variety, and has already sold 50,000. The hygienic qualities of this tree, claimed by writers in other countries, do not appear to have been realized in Algeria. The plantations have had a remarkably thrifty growth, yet no diminution in the cases of malarial fever are noted. The wood is harder than that of any other species growing in that region, and its production promises great profit to the growers, meeting, as it does, a specific necessity of the people.—*April Report, Department Agriculture.*

Ten millions of acres of wood lands are said to be swept off every year by our present population, and the destruction is constantly increasing. This must eventually make some impression even upon a continent. Alaska and St. Domingo will not supply us with timber. For the good of the whole country, for its highest productiveness, we want at least one-fifth of its whole surface covered with forest. A wise regard to his own pecuniary interests should lead every farmer to retain at least a fifth part of his land in wood. Timber is constantly appreciating in value. He cannot better provide for his old age, or leave a safer inheritance for his children.

Cows.—There are $500,000,000 invested in cows in the United States. Unfortunately, a great deal of this money is not well used. It does not bring in the yearly interest which it might and ought to yield. The average profit which the ordinary farmer receives from his cows is quite small. But they ought to pay well. If they do not, it shows either a lack of skill, or else of care and attention on the part of our owners. A great perhaps the greatest, cause of loss is, most farmers keep poor cows. A poor cow hardly pays, while a good one pays a handsome profit. It will cost but little more to keep a good cow than a poor one. The former will make from six to eight pounds of butter per week for forty-two weeks, worth say thirty-five cents per pound, realizing an income of from $88 to $117, while the latter, making only three or four pounds a week for forty-two weeks, will bring only from $44 to $60 per year. Farmers and dairymen should study these facts carefully when selecting their stock.—*Ex.*

The three year old almond trees at Santa Barbara have this year borne about 3½ pounds of almonds, on the average, while the two year olds yielded about a quarter of a pound. The crop on Colonel Hollister's place amounted to 17,000 pounds.

FLAX FOR FIBRE.

Our article in last month's issue, on flax culture, has attracted the attention of many farmers to the profits of raising flax for seed. In that article we said nothing about its value for fibre. As good fibre can be produced on this coast as anywhere in the world, and at as little expense. What we have to contend with in high-priced labor is more than made up by easily tilled soil and superior working implements to cultivate it and harvest the crop. We quote a few facts from the New York *Mercantile Journal* of interest to our readers:

"During twenty years ending 1874, the exports of wheat from America to England were more than doubled, rising from 27 to 58 per cent of the whole received in England, while the exports from Russia decreased more than one-half, fall from 23 to 11 per cent. of England's receipts. In the same decade, America received 7 per cent. more per bushel for its wheat sent to England than Russia, demonstrating the superiority of American over Russian wheat. America excels Russia in wheat; it could also surpass Russia in flax. It could supply the world with flax. During twenty years America imported 345,000,000 dollars' worth of flax and its manufacturers!

"Russia's flax mills—situated in Poland—employ 300,000 hands, and produced in 1875 $120,000,000 worth, while in 1870 America's production of flax goods was under $3,000,000. Russia ships American cotton, while America spins Russian flax. There may be a good reason for Russia's course in this respect, there is none for America's.

"The organization in Belfast of the Flax Supply Association was instrmental in the successful development of Irish flax. Flax is in Ireland what it should be in America, a principal means of public and private prosperity. In America there are thousands of Irish and Germans whose dormant skilled knowledge of flax might be utilized through a similar society to that in Belfast. Why should not one be organized in New York?

"Political economists attribute England's greatness to its factories and mines, and write of the brilliant prospect before America when these give out, indicating the time when the blasts of Birmingham and Sheffield, and the mills of Dundee and Lancashire, are transferred to the valley of the Mississippi, as the period when we shall become the merchants and manufacturers of the world. There certainly is no need to wait for England's dark hour; now is the time for a new departure in the race for pre-eminence."

The Pacific coast is the place for establishing factories for working up the fibre of flax, for here it can be produced in great abundance, and cheaply produced, too. The following from the *Willamette Farmer*, Oregon, shows what has been done there, and what may be done here as well. We hope it will set our California wheat-growers to thinking that there is possibly a better way than growing all wheat:

"Messrs. Jesse Parrish and Charles Miller, two well-to-do and energetic farmers living near Jefferson, have raised two large crops of remarkable excellence, which was established by the award of a medal at the Centennial, to their product.

"We are glad to learn that they have disposed of their lint—for they have manufactured it themselves—at a very satisfactory price, $300 per ton, which is 15 cents per pound, to Mr. Crane, who has located at San Francisco, to engage in the manufacture of twine, thread, etc. They have to refuse an offer for 10 tons to be shipped to Dundee, Scotland, for the reason that their stock is all pre-engaged. Their flax mill is now turning out 300 pounds of lint every day, and they feel every encouragement to continue the business on a large scale. Mr. Crane, of San Francisco, pronounces their lint a first rate article.

"Fifty pounds of their flax was shipped to Dundee, Scotland, through the agency of Mr. William Reid, Portland, where it was manufactured into linen and pronounced by the manufacturers as good as any in the world. The same company that worked up this sample and made this report, wrote to Mr. Reid that they would send machinery here to manufacture linen, provided they could be supplied with sufficient lint to run the first year. All these facts combine to show that flax fibre can be made a leading industry in Oregon, and lead to the establishment of important manufacturing interests in this State.

"Mr. Miller also informs us that a company is organizing in New York State for the purpose of sending an agent to Oregon to secure the raising of flax fibre to be sent back East and supply factories there. Those who are engaged in manufacturing flax there think there is no such flax raised anywhere as they have received from Oregon. We have then what seems certain to prove a permanent paying product that our farmers can depend upon for a change of crops, and which can be manufactured into lint here, and will eventually lead to the establishment of linen manufactories in Oregon. The permanence of this production and manufacture can be judged from the history of flax culture and linen manufacture for 100 years past in the north of Ireland, where great cities and immense manufactories have grown up, permanently sustained by the successful cultivation of flax in the surrounding country, which cultivation and manufacture have been a source and means of lasting wealth and prosperity. We possess at least equal facilities for growth and manufacture and can therefor count on equally successful results."

Experiments show that the amount of meat obtained from the domestic animals varies greatly, some yielding as much as eighty per cent. while others give only fifty per cent. The average is calculated at fifty-eight per cent. of the live weight of beef cattle. Sheep give forty to fifty per cent. The different products of cattle and of sheep are shown by the following:

	CATTLE.	SHEEP.
Meat	771	56
Skin	120	7
Grease	87	6
Blood	55	5
Feet and hoofs	22	2
Head	11	4
Tongue, liver, heart, spleen and lungs	43	4
Intestines	67	6
Loss and evaporation	166	20
Total	1342	110

While this estimate may not apply to every case it gives the average result of many experiments and may be relied upon in most cases.

It requires talent to so arrange the work of the farm that every portion of it shall be done at precisely the right time. Work done out of season is almost always expensive. In the hurry to catch up there is loss.

[For the California Agriculturist.]

A TALE FOR THE NEW YEAR.

BY NELL VAN.

"Happy New Year, little one," said mamma, as Amy opened her blue eyes on the first day of the year 18—. "Oh, dear; is it really, truly, New Year's day at last?" enquired the child, springing out of bed and hurrying on her clothes. "Yes, my dear; New Year's day has come at last, and how will this little girl spend the day to make it a happy one to be remembered?" "Oh, I always love New Year's day better than any other day in the whole year, I do believe. We are going to have such fun. Cousin Minnie and Emma are coming, you know; and you will have callers all day, with a big table set out in the back parlor with lots of goodies. I saw cook fix the big turkey yesterday and stick cloves all over the boiled ham before she set it in the oven to brown. And then the pickled oysters and coffee always smell so nice; crullers and mince-pie, besides nuts and candies, cake and wine, and everything nice. Mayn't we have a little table of our own set out in the basement, and have Ralph and Johnny and the other little boys come in to call? And Mayn't I wear my blue dress and sash all day long without any apron to hide it? and twist up my hair with a comb so as to look exactly like a big lady?" "One question at a time, Amy. You know I will be busy in the parlor all day with company. I shall therefore dress you this morning in your blue dress and sash, but you must wear a big apron till your cousins come, when the house will be thoroughly warm. You cannot wear your hair in a comb; it will spoil your curls, which are becoming to a child of your age. Not crying! Fie, Amy! for shame! To begin the year with tears! Looking up through her tear-dimmed eyes the little lady said, poutingly, "When I am a big lady and you are my little girl, I'll never make you wear big aprons; you see if I do." "Why, Amy child, do you suppose I can grow into a little girl again? Do you forget that I was once your grandma's little child, just as you are mine?" "But, mamma," persisted the child, "I heard the minister say once something about folks being born again and becoming like little children before they could die and go to the good place. Of course you'll be my own little girl then when you get born again. Who else could I love as well as you my dear, dear mamma?"

The door suddenly opened and Amy's father entered with a laugh, saying: "That's so, Amy darling, who else could you love as well as dear, dear mamma? You are both my little girls now, so I'll toss one upon my back and tuck the other under my arm, and away we'll go down stairs to see grandma and the pussy cat."

Mr. Burchard was a successful New York merchant. His home was located in an aristocratic quarter near Gramercy Park, and he was one of the very few whom prosperity did not spoil. Amy was an only child, tenderly reared yet well governed. She seldom rebelled, though exceedingly active, and usually strove to please her kind parents and grandmother. New Year's day in New York City is given up to the good old Knickerbocker custom of giving and receiving calls. From morning till night gentlemen may be seen paying their respects to lady friends, who honor the occasion by appearing in holiday attire and offering the compliments of the season in a glass of good wine. Mrs. Burchard was young and lively. Her husband being fond of society they entertained a deal of company, and were capable of exerting an influence of which they seemed wholly unaware. The moderate use of the social glass among friends was by them considered unobjectionable, they holding that temperance truly meant keeping the appetite at all times within bounds, Judging only by their own standpoint, they little knew the false reasoning this was to one with perverted tastes.

But two return to my story. The two cousins had come, and Amy was in an ecstacy of delight. New books were added to her store of presents, and her indulgent mamma had given her permission to keep open house on her own account in the basement dining-room. Ralph and Johnny had been notified, and they were to tell the rest of the lads in the row to call on Amy and Minnie without fail.

Just before noon a small group of young men entered Mrs. Burchard's beautiful home, among them Charles Mallory, a fine-looking youth, who knew well his one great failing, and had times of manfully struggling against it. It was an inordinate love for liquor. The smell of wine was delicious to him, and he had that morning inwardly resolved not to taste one drop of anything stimulating. He even denied himself the pleasure of accompanying Jack Burton and a couple of congenial friends in a carriage because he feared the result. And here at the outset he was met on the steps by Foster and two young Southern bloods. They entered together, were introduced to Mr. Burchard's pretty neice, and he found there was no resisting the urgent solicitations of his kind hostess, who said entreatingly: "You surely will not refuse to drink Miss Emma's health in this harmless glass of sherry?" The same old story, thought Mallory. He said aloud: "Pray excuse me, madam, the day is scarcely begun, and I have many calls to make. A first glass often paves the way for more, and I begin the year with good resolutions, which you should help me to keep." Don't preach temperance on New Year's day, Mallory," cried Foster, thippantly; "you'll be putting away the egg-nog at Mrs. L.'s by-and-bye without a qualm of conscience; see if you don't; eh, Charley?" "New Year's comes but once a year," said another, bowing, while another looked indignant at this breach of etiquette in thus openly declining the hospitalities of the fair hostess. "No, we can't excuse you, Charley," said Foster: "you are always in the dumps till you get a glass of wine," he whispered. "Come on." Thus importuned, was it any wonder that good resolutions were cast to the winds? The whole party clicked glasses and drank to the health of the ladies.

There was silence for a few moments after they had left, and Emma remarked upon Mr. Mallory's reluctance to take wine: "Yes, poor youth! he bids fair to follow in his father's footsteps. *He* always took wine with his dinner, and several glasses a day besides, and died a victim to delirium tremens. His son inherits the same taste for drink, and though he tries hard to break up the habit he invariably fails, as you saw him just now. Why, aunt, don't you help save him, instead of urging him to drink? And to *my* health, too! I could have cried with vexation." "But, my dear," said the worldly aunt, "what am I to do when society demands that hospitality consists in offering cake and wine to our guests on certain occasions?"

More visitors were announced, and the incident of the morning was soon forgotten. The smell of burnt clothing came up from below. The cry of "Fire!" was heard; the rush and hurry of many feet, and loud voices of men. A carriage conveyed the ladies and children to the nearest hotel. It was impossible to imagine where Mr. Burchard could be found, so little Amy could only content herself by sitting at one of the long windows of the hotel watching for him to pass that way. Fancying she saw him, she begged leave to go with her cousin to the door; but it was not he. A neighbor's boy passed on the other side of the street, and beckoned Amy to come over. "I'll be back in a little minute, Minnie," she said, skipping away. The boy promised to find her papa for her if she would go with him; but stopping at a fruit store to buy some peanuts, Amy wandered on alone, saying to herself, "I know I can find my papa alone. I know him better than any one." The boy, supposing she had gone back to the hotel, took no notice of her absence; but Minnie strained her eyes to catch a glimpse of the little blue dress of her cousin, but in vain. She returned to the parlor to tell the tale of Amy's new exploit. "Gone to find her father! Impossible!" exclaimed the terrified mother starting to her feet. "Go, somebody, and bring back the child." "She is safe with Willie Jones; he will let nothing harm her, and she was well wrapped up, you know," said Emma, tenderly. As the day wore on and Amy did not return, more than one anxious heart throbbed with impatient suspense.

In the meantime, how fared the young wanderer? Worn out with fatigue, she sank crying upon the steps of a dwelling. "Poor little dear," said a kindly voice, and looking up she saw bending over her an old gentlemen with glasses, who enquired her name and where she lived. "I'm Amy Bunch, sir, that's what they call me; and I live on—oh, I don't live anywhere, 'cause our house was afire and we went away, and I can't find my papa to tell him about it." "Who is your papa, child?" enquired the stranger. "He is only papa, and mamma calls him "idea." "But what is his name? and does he keep an office or a store?" "Oh, I don't know, sir; he only goes down town, and to-day went out to make calls. Oh, *dear*, what *will* become of me? I want my mamma and papa so bad." "Come with me," said the stranger, kindly, leading her to the nearest station, and begging the officials to see that the lost child was restored to her parents went his way. As night came on, the unclaimed children, of which there are always a number, were sent to the Foundling's Home till they should be found by their friends. Among a crowd of little ones Amy was placed under the kind guardianship of Mother Bond, who enquired their names, gave them some supper and clean beds to sleep in; but Amy could not eat, and wept herself to sleep.

We must now pass over a period of six years, during which time the sad-hearted parents had exhausted every means for discovering the whereabouts of their darling, except that of visiting the Foundling's Home. From time to time children were apprenticed out from the Home till they should become of age.

When good Mrs. Mallory sought there a nurse girl to mind her baby boy, she selected Amy from the rest, and as the child's early answer to the question, "What's your name?" was invariably, "I'm Amy Bunch, ma'am," her name was put down on the books as "Mamie Bunch," and as she grew out of childhood she was called "Mary."

Any change is grateful to the young, and their hopefulness colors the future with rainbow tints. Mary was glad to leave the Home after the good-byes had been said, for the big world outside the walls of the playground seemed inviting. Her early life was shrouded in mystery. She had a faint remembrance of a life amid luxury; downy beds and soft cushions; dainty carpets and fine pictures; books, toys, and of being petted and caressed by kind, loving parent. She could remember a day when all this ceased, and then a blank. Poor child! She was now riding with her new mistress in the capacity of child's nurse, and was to be taught to make her way in the world like many another of gentle birth.

It has been said "There is a skeleton in every home," and the time came when Mary was to discover the one in the Mallory household. Intemperance, like a grim spectre, haunts the earth, deluding its victims and blighting innocence with its foul and loathsome breath. The youth who strove to resist the tempting glass in Mrs. Burchard's parlor that eventful New Year's day, from that hour lost command of his appetite. He married a simple-hearted girl of inferior position, and her invariable excuse for his one great failing was: "He is only like other men, and there is always a something." They sat one evening, her mistress and Mary, watching beside the crib of the sick child, when loud noises were heard at the hall door and an angry voice demanded admittance. "You sit here, Mary, and I'll go," said Mrs. Mallory. Poor Mary, trembling with fear, said within her heart, "What dreadful beings men are! I'm almost glad I never knew my father, for fear he was like the rest." Hurried steps were heard approaching, and the loud voice said: "Where is the brat? It has stood between sin and I long enough, and this will end it now and here." He rushed into the room brandishing over his head a long knife. With sudden presence of mind Mary sprang to the crib, and lifting the child in her arms with its blankets about it she rushed through the open door out into the night air, and ran she knew not where, till overcome with fatigue she fell and struck her head against the curbstone. A crowd collected, and the girl and her sleeping burden were carried into a house, where a physician was sent for. Stunned by the fall, it was some time before she recovered herself. When she opened her eyes they met those of a lady who sat watching beside the lounge. Her soft white hair was banded back from her brow, and her countenance expressed sympathy. There had been a trinket, which Mary had always worn on a gold chain around her throat ever since leaving the Home, when the Matron clasped it there and told her it was the only link between her and her mother. This had snapped and fallen to the floor as they brought her in, and her first impulse upon returning to consciensess was to put her hand to her throat. "Here it is," said the lady, tenderly; "how came you by this?" "Oh, ma'am," sobbed Mary, "I had a mother once, and this is all I have left. Where's baby? Did it get hurt, too? Oh, but my poor mistress will be wondering where I am." "Tis Amy! Oh, come, father, see! Our lost child has come back to us! The old child-lish look is in her eyes! Poor dove! She has flown from the persecutions of the drunkard I in my blindness helped to make, straight into the old home nest!"

W. D. F. Richards of Ventura county, realized $6,500 on 200 acres of flax, or $32 00 per acre.

Correspondence.

Letter from Lompoc Temperance Colony.

Editor Agriculturist:—I am a close reader of your valuable paper, and have not seen anything from this section of late. I said "valuable" paper, but hesitated about using so hackneyed a term. But I speak it conscientiously. Your columns do contain such varied, reliable and instructive reading matter, alike for the farmer, his wife and his children, and the moral tone is so sound and strong, without any whining or cant, that I feel free to use the word "valuable" advisedly. In this "Temperance" Colony your paper is, and ought to be, appreciated for the noble stand you take against advocating, countenancing or advertising intoxicating liquors as necessary to the public good or as any part of so honorable a calling as agriculture. God speed you, say many of us, in your denunciation of those who prostitute what should be useful Agricultural Fairs into gambling, horse-racing, pool-selling, black-leg institutions. I am truly glad to see you and other agricultural papers advocating the drying of grapes for raisins, making of syrup, jellies, etc., or even feeding them to hogs, instead of making of them liquor, the curse of our age and country. I must think you are thus doing the State a substantial service, and not less the grape-raisers than the consumers. There must be a great and increasing demand for all dried and preserved fruits. Take new territory like this, filling up so rapidly; until our trees and vines bear sufficient for home consumption we afford a good market for green, dried and preserved fruits. I often wonder that those who produce these wholesome and desirable srples do not communicate with some merchants, or grangers, and supply, *direct*, the community, without first selling to San Francisco merchants, from whom the local storekeepers of each community must buy, at an increased cost to the last, the retail purchaser.

We are raising an immense amount of produce in this valley, beans, potatoes, pumpkins etc. being the principal. Considerable grain was put in and did well. Fruit trees are making a vigorous growth. Special attention is being paid to hog raising. We can raise ample food, and the climate just suits for making bacon. They have fetched a fine price, seven to ten cents, on foot, to those who were fortunate enough to have a stock to sell to others who were determined to have a start in these prolific and profitable animals. A good deal of our fine dairy land is sold and settled. We have a continual influx of new comers, which "astonishes the natives" of surrounding places, especially those croakers who boldly asserted, and were anxious to "bet money" that it would be impossible to keep out saloons and the sale of whisky, and who confidently predicted the valley would never settle up, nor the town amount to anything without liquor selling. If Lompoc be a failure I would rejoice to see a thousand such failures in our glorious State to-day. We are not without our misfortunes. We had a touch of potato blight, but we were worse scared than hurt by far. The most of people will hold their potatoes for a higher price. The elements have been against us. During a recent northwest gale a considerable portion of our wharf was moved off bodily, as the flooring was spiked down hard and fast on to the piling, which proved not to have been sufficiently high. The experience is rather expensive, but it is hoped that the repairs will stand, as we have abundance of long piling to raise the floor above the reach of the upward pressure of incoming waves. The workmen have already commenced repairing. The large warehouse is about completed, and is filling up with produce awaiting shipment and good prices. We still load schooners at the part of the wharf remaining, which runs out about 900 feet, I understand. We have had no rain yet to damage anything. If plenty comes hereafter it suits us best, as it gives us a longer season in which to harvest the large crop raised. A company has just been incorporated for the purchase of adjacent ranches, for the formation of another temperance colony, to be called "New Vineland." If it be fully launched, I have no doubt your advertising columns will give information in general, and tell where all details can be ascertained. Elder J. W. Webb, well known as a leading spirit in Lompoc, and a public worker in the temperance cause, is President, and Charles Maltby, formerly Revenue and Indian Agent in California, is Secretary. In the Los Alamos Valley a large amount of land has been leased to farmers at very reasonable rates. All this country will be settled up ere long. I hear the "College Grant" is being surveyed. I do not think of further items of interest, and this letter is, maybe, too long already. Respectfully,

J. W. W.

Lompoc, December, 1876.

Growth of the Lompoc Temperance Colony.—Says the *Record*: In November, 1874, the Lompoc rancho, where now is centred near fifteen hundred inhabitants, was a common California sheep or stock ranch, known only to the stock men of the State as a superior grass producing region and occupied by some thirty or forty thousand head of sheep. Since that time the major part of over 46,000 acres of the finest valley and hill lands in the State have been sold to four or five hundred different persons, mostly heads of families, who are either here or intend coming as soon as convenient, in tracts to suit their means, and on the installment plan which enables the poor man to work out his salvation and secure a home. In two years and a half our colony will have built three school edifices, one costing over $5,000, affording school facilities for over three hundred pupils as per last report of Census Marshal. The business of the colony has grown to quite respectable proportions. Five mercantile houses, a drug store, livery stable, two blacksmith and wagon shops, one furniture store, two tailor shops, one shoemaker shop, two hotels, two confectionery establishments and postoffice and telegraph, two lumber yards, and parties now among us intending to open in trade soon as suitable buildings can be erected. Our people have made many fine improvements, such as erecting tasty dwellings, etc.

TRIAL OF SEEDS SENT OUT BY THE AG. DEPT., WASHINGTON.

Lompoc, Nov. 27, 1876.

Ed. Agriculturist:—I have to-day sent a report to the Clerk of the Agricultural Department of the seed you gave me. The bearded spring wheat was very productive; 100 lbs. from a quart The Chevalier barley, light, 55 lbs. The white oats, good, 55 lbs. from the quart. The Turban squash, splendid for pies, too dry for baking. The large *smooth* tomatoes, a mistake. The cantaloupes, watermelons, beets, etc., good, but not superior to those already used.

Yours Truly,

Irving P. Henning,
Sec. L. V. P. Co.

Saratoga, Nov. 24th.

Friend Herring:—As was promised, here is the report of the planting, growth and final result of the seeds obtained through your office last season. The first planted were the peas, McLean's Little Gem and the Philadelphia Early. I can recommend both these as being tender and well flavored; they are both prolific bearers, the first named being about ten days earlier than the Philadelphia Early. They received no irrigation. The silver-skin onion proved to be small and very mild. The cauliflower (Asiatic) seed came up slowly, the plants grew reluctantly, and died after transplanting; were well watered and cultivated. I am not at all acquainted with the nature and habits of this plant, and treated it the same as I did cabbage. Was that right? [Yes—Ed.] The black wax bean is a sturdy plant, and the beans are good either green or dry. The brown Valentine beans were received so late I did not plant them. Will report on them next season. Of corn, I had two varieties, Stowell's Evergreen and Early Minnesota. Of the former, a little came up, but did not amount to much. The latter did not make its appearance above ground. Both these varieties were well spoken of in the Eastern papers a year or two ago; but judging from the appearance of the seed I had, it was not fully ripe. Of cucumbers, there were the long green Spine and early white Spine. The last mentioned did not germinate at all, and the birds pulled the others up almost as fast as they showed themselves. The melon seeds, of which there were the Orange watermelon and Pineapple muskmelon, did not come up. The seed was very light. The Boston Marrow and Early Bush squash came up and did well. The Early Bush is good and tender, but must not remain a day too long on the vine, or it will be too strong. I had Cook's Favorite and Improved Trophy tomatoes, and can speak highly in their favor. Cook's Favorite is smaller than the Trophy, but is smooth and fully as well flavored. The vines are still full of fruit (Nov. 24th), but the cold weather allows it to ripen so slowly that it is rather insipid. We are obliged to contend with birds and rabbits to such an extent that unless everything is planted close by the house, it does not amount to much. I was obliged to do all the planting and cultivating this season, and as I was a perfect novice at such things, perhaps I was partly the cause of such ill success. Next season I hope to do better.

E. L. Hoppell.

Let it be remembered that the finer we make the soil, the nicer the bed in which to put the seed, the easier and faster the plants can obtain their food. The more we cultivate the soil the finer we make it, and the faster our crops grow. This principle we ought to understand and apply, since it lies at the foundation of economical and successful cultivation.

"Funny monkey," said Mrs. Partington as she saw him patiently sitting, "but he sets as if he had the plumbago in the back, and I could wish there was more hair on his reprehensible tail. I cannot yet believe, neither, that they're our postcrity."

Apiary.

Bee-Keeping in Southern California.

The California bee season, Mr. Harbison says, begins by February 1. In March or April the bees swarm, and the bee-culturist has lively times in saving the swarms. The science has become so systematized now that the apiculturist knows within a day or two when a given hive may be expected to swarm, and as the young bees always settle somewhere near the parent hive at least once before selecting their new quarters, a swarm is seldom lost. The flowers are at the height of their luxuriance in May and June, and the taking of honey is begun usually about May 20, and the bees are kept at work as long as the flowers last. They cease to bloom in sufficient quantities to more than subsist the bees in the early part of August; but the little workers are able to find enough to live on without consuming their stores as late as October. It will thus be seen that the harvest time is never longer than three months, and is often much less. After October begins, although the air is still mild and spring-like, the bees cease to work, and retire into a semi-dormant condition. Once every eight or ten days a colony will turn out at midday and fly around for an hour or two in the sunshine, but they never fly far from the hive, and are never seen at work.

The food of the bees in the bee belt is generally the flowers of the white sage, a plant that closely resembles the garden sage. This is not to be confounded with the sage brush of Nevada and Utah, which is of the wormwood species, and has the family bitterness. Next to the sage in importance as bee food is the sumac, a shrub that grows in California without poisonous quality. In fact, there is no poisonous flowering plant in the bee range, and the honey has none of the colicky qualities that make Eastern-grown honey objectionable. The honey is graded by the culturist according to the plant from which it is derived. That made from sage flowers being clearest and most aromatic, is most valuable.—*New York Sun.*

Bees In California.

Moths have been a source of annoyance in our apiary for years, having lost many stands by their ravages. Mice, lizards, spiders, etc., have sometimes obtained possession of our hives, but such will not be the case in the future. Moths are not going to be tolerated as heretofore; more care will be observed in watching the hives, and every precaution will be used to avoid their being in the hives unmolested; also so of spiders, toads, &c.

We consider it pure negligence to lose a stand of bees in this state by starvation, moths, etc. As for us, we never took a hive off the summer stand to protect it from the rain, frost, etc., for the winters are never so cold as to freeze the bees. The only protection required is to keep the water from entering the hives, which would cause the combs to mould, and if any litter should have accumulated on the bottom board it would become decayed and would cause disease. It is a rarity here for dirt and dead bees to remain for any length of time inside the hive if the stock is in a strong condition and it is well to always have the hive well stocked with inmates, (not moths and other vermin,) for when so

kept bees will see that the inside is clean. Although it is a common custom in the northern part of this State to leave hives unprotected, we strongly recommend a neat, cheap, and durable covering, to protect them, not so much from the rain, etc., of winter, but more from the heat of summer. We find that hives placed in a cool location, the bees do much better than those that are exposed to heat. —*U. K. L., in Bee-Keeper's Magazine.*

A Few Words from Southern California.

I feel as though I must enter my protest against some of the sweeping assertions made in the July number, by R. J. Colburn, of Chicago, in regard to the bees and honey of Southern California.

After giving to that section the preference as the greatest honey-producing country of equal area in the world, he says: "I am further satisfied that its distance from good markets, and liabilities to the disease known as 'foul brood,' as well as ravages from the moth, may reduce the high estimate some people have of it." True, we are quite a distance from market, but we cannot always get producers and consumers together. California wheat is the best the world produces, and it pays to ship to Europe; that may yet be the best market for honey; and at paying prices too. Then, the yield of honey is so abundant here, (in good seasons) and our losses of bees so small, that we can as well afford to ship our honey to Chicago or New York, as those who live nearer, and lose from one-quarter to three-quarters of their colonies every winter. As to 'foul brood,' it is something I know nothing about, never having seen any of it, nor met with any one who has in Southern California; but I have *heard* that there was some of it in Los Angeles county; and I am of the opinion that it will be found (if found at all) on low, wet lands, or near wine vats. I often hear the remark, that the two great drawbacks to successful bee-culture in the "States" we do not have to contend with here – foul brood and wintering.

As for the moth, occasionally we find a worm in the hive, but not often; and I believe, with Mr. Langstroth, that a strong colony, with a prolific queen, need never fear the ravages of the moth; but a queenless one is almost sure to fall a prey to them here or elsewhere.

Again, he says: "In regard to the quality of California honey, it seems to be the opinion of every person who has tasted it, with whom I have talked, that it cannot compare with our white clover, except in looks, 'Novice' to the contrary notwithstanding. But its looks sells it." There is quite a difference in the quality of honey in different localities in Southern California. In the neighborhood of Santa Barbara—where we lived five years, and had some experience with bees—the early honey, gathered largely from alfillarilla (filarei—commonly called) is very fine; but the late honey gathered from the "tar-weed," mostly, is dark in color and strong in flavor. The eastern part of this county, where there is abundance of white sage and sumac, produces as fine honey as the world ever saw. The early honey is equal to that gathered in Santa Barbara county, from nearly the same plants; and the later, gathered from the white sage, I would venture to place beside *any* white clover honey to be found by *any* bees in any State in the Union. It is clear as water, thick, and of a flavor to tempt—mortals. Apiarists, who have kept bees east of the Rocky Mountains, and in California, give the palm to the white sage honey above the white clover. The honey gathered from the sumac—not the eastern sumac—I *think* is not quite so light-colored, though it is hard to determine, as it commences to flower before the white sage is gone. The white sage harvest commenced about the third week in May and closed about the middle of July. The sumac commenced to flower the middle of June, and closed about the third week in July. I have conversed with those who have been in Los Angeles and San Diego counties, and they say that the white sage grows in great abundance in most of the mountain regions; so, I cannot but believe that the bee-keepers there get just as good honey as we do. I saw a statement in the *Bee-Keepers' Magazine*, several months ago, that a large shipment of honey had been made from California; but it was of inferior quality, and would probably remain long on the market. I understand that that honey was gathered in the neighborhood of Sacramento—how near I know not—on "tule" lands.

Now, it may be, that those persons who passed judgment on California honey, "tasted" of this honey; if so, according to all I hear, the taste of it must be in their mouths yet. I do not want to see California honey condemned on account of it, either. I am satisfied they never tasted white sage honey, or they would never say "its looks sells it." I am sorry to see in G. F. M.'s communication, in the August number, that most bee-keepers in this locality are losing money. Such is not the case here; and I do not "think the whole business overdrawn." A person cannot go into the bee-business in a comparatively new country, like this, and *live in the city*, where his family can have all the advantages of society, and make money. If he wants his bees to gather the best honey, he must *go where it is*, if it takes him to the foot of a mountain, or up a canyon. If he is able to keep his family in town, well and good; if not, let them share the hardships and deprivations, and get rich, (and I believe they will, if they stick to the business here) then move to the city and to society. Land in this or Santa Barbara counties does not have to be irrigated to produce a crop, but if well farmed produces splendidly.

We started in this year with 80 colonies of bees in the Langstroth hive; have taken off 850 boxes of honey, averaging 5½ to 6 lbs. each; shall probably take off 50 more. Have not got through extracting from the lower part of the hive, but have averaged over 33 lbs. to the hive as far as extracted. We have increased 89 colonies. That will make about 1½ tons extracted honey, and over 2¼ tons box honey. If this is a failure, I hope I may never make a worse one.

This has been a very poor season, not having any rain since January 6th, to amount to a shower. We had a frost in April that did considerable damage to the bee pasture, and a dry, hot wind the 9th and 10th of May that dried up the flowers to such an extent as to nearly stop the gathering of honey, and the bees tore down all their queen cells. I have already made this letter too long to be acceptable, I fear, so will close.—*E. G. K., Ventura County, Cal., in American Bee Journal for December.*

How to Fit Empty Combs into Honey Boxes.—Take the combs carefully from the frames and lay them on a folded towel, as in transferring; cut into pieces a little larger than the box, slide and crowd them carefully into it. Put in the glass and set the box over a strong colony whose hive is filled with honey. The bees will fasten the pieces nicely in a short time, if it is done while the weather is warm.—*American Bee Journal.*

PHOSPHORUS WHEAT TO DESTOY SQUIRRELS.

An Easy Way to Mix and How to Use.

Mr. H. G. Batty, of Milpitas, the Squirrel Inspector for that district, furnishes us with his way of preparing and using phosphorus poison for squirrels:

Take a five-gallon square kerosene can; cut out a side, clean it; punch a hole in each end of can and tie in rope for bail. This makes it convenient to carry, and it is the best handy vessel for the purpose that I have seen. Fill can to depth of half an inch with boiling water; add one-half teacupful hot syrup, and one full stick (or more) of phosphorus. Mix to a thick gruel with middlings or graham flour. Add your wheat now, a quart at a time. Stir well until the can is full as is convenient to mix. If it is too sticky, mix until dry with middlings or graham, till the wheat will scatter when thrown in front of the holes. I have poisoned for the the last six years with success in this way. A tablespoonful at each hole, scattered, is the way I use it. My stock has run in the field all the time, often a hundred head, without the least injury. By *scattering* the poisoned wheat, stock cannot pick it up, and the squirrels will eat it better. Few few squirrels will be found dead outside of their holes. I have seen fields that were alive with squirrels when the phosphorus wheat was put out, and the next day hardly one was to be seen. We think that this is the cheapest poison to use at this time of the year. I have had greater success with it than with Wakelee's poison. In handling the phosphorus in the stick, be very careful to keep it covered with cold water. A good, safe way to keep phosphorus is to set the can in another can filled with water, away from any building. In mixing, do not inhale the smoke. We prefer to mix in the open air, setting the can on hot bricks or stone covers will tend to keep it warm while mixing.

We invite further reports upon this subject. We approve of Mr. Batty's way of preparing the phosphorus wheat for poisoning squirrels; but we wonder that he has not poisoned stock by scattering it outside about the holes. Sheep or hogs would certainly be in danger to run where phosphorus was thus scattered, also birds and game are likely to be poisoned. We once saw, in Salinas Valley, dozens of hogs lying dead from poison, by eating the dead squirrels poisoned with phosphorus. The squirrels were poisoned in an adjoining field, and went for water into the enclosure where the hogs were running. We think a word of caution here necessary, and would advise throwing the poisoned grain into the holes, out of the reach of other animals, birds and game.—Editor Agriculturist.]

ARTESIAN WELLS – STRAWBERRIES.

The lands lying between San Jose and the bay, within the artesian basin are fast being converted into vegetable and fruit lands. On lands where water has to be raised by wind, horse or steam power, above the artesian basin, the culture of such fruits and vegetables as require a good deal of water, has yearly contracted. An abundant supply of artesian water on lower lands has so cheapened the cost of production that competition on lands where water has to be supplied by power, with much profit, is out of the question. The average depth of good flowing wells is about 200 feet, although the range is from 60 to over 500 feet. The general charge for boring is—

First one hundred feet	.40	Cents per foot	
Second "	"	.65	" "
Third "	"	.90	" "

And so on in like proportion. The cost of seven-inch—the usual size—is seventy-five cents per running foot (double). This would make a 200-foot well cost $315 complete. A 500-foot well costs $1,500, or more if the pipe has to be renewed. These figures we take from Mr. Geo. Byron, of Alviso, who has just completed a 200-foot well, which will supply a large plantation of strawberries. The artesian region is *the* strawberry field of California. Several large, new plantations are being set out this season. The finest berries in the State are grown in our valley.

Cheap Storage of Tools.

A few years ago, in company with several brother farmers, I visited one of our State premium farms, located in this (Knox) county, Ill. Among the many things worthy of commendation, was his cheap and simple store-room for farm implements, which stood a few rods from the barn, away by itself in the corner of a grove of young growing timber. Posts were set in the ground on the back side some five or six feet high. The front posts were some two feet higher, and the room was about 12 by 20 feet. The roof boards were matched and battened; the side boards of common stuff. The floor was made of loose boards. The door was 8 feet wide and 4 feet high, hung with heavy strap hinges on top, all safe against snow, rain and sun. Here were his reaper, mower, roller, wire-tooth hay rake, watking two-horse cultivators, (riding cultivators out of date), harrows, plows, and room for a sled and cutter during the summer. The hen roost was in another building—none were allowed there day or night. Here, at an expense of 600 or 800 feet of course lumber, a few pounds of nails, a set of heavy strap hinges, and one day's work in putting up the building, at a total cost of about $15, he had all that was necessary for the object desired.—*C. G. T., in Country Gentleman.*

Benevolence at a Discount.

In our views of things, whatever has a directly beneficial influence upon the physical health of people should not be hedged in by iron-bound restrictions, so that they who would try to adapt it can not unless they submit to the exactions of the monopolists. When we meet with a paragraph like this in a periodical of general circulation,—

"Patterns are not for sale All these garments are fully covered by patents, and infringements will be rigorously prosecuted by law."

—with the fact before us that this cast-iron policy relates to an improved method of dress for women by which comfort and movement are promoted, we are inclined to believe that the persons who maintain such a policy in business would bottle up the atmosphere if they could, and institute legal proceedings against all found uncorking it without having previously bought the privilege of doing so.

Our habits of thought and business may be all wrong in the matter, but we have always believed that in things of so much importance as the preparation of

food and the construction of clothing, it was a principle of duty and benevolence to give as wide circulation as possible to methods—new or old—which will tend to promote health. We supposed that, in the matter of "dress reform," all its advocates were philanthropically inclined, but the paragraph above shows how easy it is to mistake, and that some people, who have a "good thing," will obtain a government privilege for its exclusive sale. Doubtless "there's money in it."

Thus justly says the *Phrenological Journal and Science of Health*, referring to some eastern reform under-garments. Now, be it known to all good people, that the C. C. C. Company of San Francisco, have *better styles* of reform underclothing—the invention of a philanthropic California lady well known to the editor—and they offer to sell patterns to everybody. They also manufacture to order, when desired. See advertisement in this issue of the Agriculturist, and profit by it and be happy. Benevolence *not* at a discount in this case.—[Ed. Ag.

Imaginary Sorrows the Cause of "the Blues."

The old story of "The Smoke House," is thus put into rhyme by Mr. H. H. Tuttle, of San Jose.

An old lady sat at the smoke house door,
While she wept, as women have wept before.
Her husband came, with a heavy heart,
Real peace and comfort to impart.
Says he "my darling, dearest wife,
You've been my comfort all my life.
Lean now on me, your troubles tell;
I'll bring relief and make you well."
At these kind words she raised her head
And heaved a sigh, and thus she said:
"Our Sally dear is small you know,
But large in time is sure to grow;
And married then she'll likely be,
And live the same as you and me.
In time a little boy will grow,
Mark well my word, it will be so;
And full of antics, full of tricks,
His horse he'll play with whip and sticks.
And in this house I now do see
The little fellow, full of glee;
That form you see a swinging there,
Suspended now in open air,
Is falling on his little head!—
My God! dear man, the child is dead!
And into grief the woman flew,
As tho' the thing were real and true.

The Object of Manuring.—The object of manuring is to keep the crops abundantly supplied in available forms with all the kinds of food they require throughout their growth. All our crops require the same kinds of food, although in somewhat different proportions.

Farmyard manure is, and apparently must always be, our stable manure. It contains all the elements our crops require, and is the cheapest form in which the whole of them can be obtained.

More than half of the weight of all plants is made up of elements which the plants get from water and from the atmosphere—the leaves being put out by the plant to absorb food from the air just as the rootlets absorb it from the soil.—*North British Agriculturist.*

Look to the water supply for your stock, see that it is pure and plentiful, and by so doing keep them healthy, and they will reward you for the feed which they consume. See to the winter quarters for your stock, have them well supplied with good food, and so keep your stock in good condition. You will gain by every attention you can pay to your stock in keeping them warm and comfortable.

Household Reading.

[For the Agriculturist.]

DOTTINGS AND JOTTINGS.

BY ISAAC KINLEY.

These sermons in stone: The earth has dagnerreotyped its history on the rock, full of instructive lessons for those who will take the trouble to read.

This little fossil, not so large as a walnut, is a petrified organism that lived, I dare not guess how many ages ago. Buried in its rock-built mausoleum, the deposit of ancient ocean, it has lain under these Silurian rocks for uncounted ages. During long, long years, rolled over it the waters of a mighty ocean. During long, long ages, strange wild beasts, such as live not now on the earth, roamed, and howled, and preyed on one another in a primeval forest. During thousands and thousands of years, this river has been widening and deepening its channel in the solid rock. For unknown ages a race of men whose very traditions have been lost, lived and loved and huuted on its banks. And for an unrecorded time the red Indian roamed the denizen and lord of this wilderness.

A new race of men—a new civilization is here. And is it not strange, almost to bewilderment, that geologic cycles, men, nations, whole races, pass like a figment sway and this mollusk endures?

And I can look upon it, handle it, nay, reason about it, and learn from it the races that far back in the dim twilight of time peopled this primeval ocean.

At creation s early dawn, when matter first assumed organic form, this little stone was a living being—a type, perhaps the highest, of the then existing life, and a prophecy of the higher developments during the millennial ages to come.

I hear of human reason as something in contradistinction and antagonistic to the divine. The power to distinguish the relation of things, to perceive truth, and to deduce cause from effect or effect from cause, is indeed a human power, the crowning one of the human faculties.

Whatever be the nature of truth—call it human or divine—it is a human faculty which perceives and comprehends it, and this clamorous denunciation of human reason is but human stultification. Whatever you know, my reader, whether it be a revelation from God, or of the discoveries of science, you know through your powers of reason, and you could as well disparage the human hand that earns your bread as the human reason that thinks your thoughts.

Reason is the sword of truth, its buckler, and its shield. Distrust it not. Put on the armor and meet boldly the issue.

In the commonwealth of reason property is secure, and action free. No one can say of the deductions of reason or the precepts of truth, "This is my property to the exclusion of my neighbor;" nor to the free mind, "Thus far shalt thou go and no farther." God has given us the vast territory of truth. We have but to explore, and subdue, and it is ours. All known truth is property in possession. All unknown, but knowable, truth is property in abeyance. The mind's dominion is bounded only by the impossible and the infinite.

Save me from those who *know*. When one only *believes*, he is likely to have a reason for the faith that is in him; but if he *knows*, his assurance cuts off investigation, though his assumptions are without a sustaining fact or argument.

But there are those who will believe a positive man without a reason rather than a modest one whose reasons are demonstrations. The dogmatist has followers, and the Mormon prophet builds up a church while the philosopher has only here and there a listener.

Nature lives, and by an innate energy is ever struggling to higher life.

Plants, animals, and the human race itself, grow; not only as individuals, but develop as races.

The works of God are no failure. During the infinity of geologic cycles, from the birth of the first monad, nature's motto has been, "Higher and still higher."

Upward and upward is nature's law, and the history of her march is written in her own vernacular on the rocks, and all who will may read.

Pain, physical pain—struggle as one may, long years of bodily suffering will conquer at last, and, in spite of him, groove the face with lines of agony.

Philosophy is indeed a good thing, and dogged endurance even better; but both must succumb. And though there be not a whit of good in it, one groans through his very resolution to endure.

As sledging gives muscle to the blacksmith's arm; so thinking increases the power to think. He who masters one subject gains thereby in mental capacity and is the more able to grapple with other and more difficult ones. The mind as well as the body needs its gymnasium. All the faculties clamor for exercise.

Drink, if you will—drink deeply—drink to the very dregs the cup of bitterness.

Is it sweet? Is there joy in it? Then fill and quaff again; and when your breath is a pollution, and you have become a putrescence, stinking with moral rottenness, enjoy whatsoever there is of joy in the reflection that all this abomination is your own work—this hell on earth your own creation.

Those persons who are ever suspecting others—who ascribe good deeds to bad and sinister motives; it is their own peculiar devil that inspires. Do not trust them; they will deceive you. Do not confide in them; they will betray you.

"However darkly sin may twine
Its threads around the human heart,
The impress of the hand divine
Can never utterly depart.

And though the taint of every ill
Has marred the spirit with its blight,
Some leaves are pure and stainless still—
On these at times the angels write."

No one is so good but he has some alloy of badness. No one is so bad but he has a trace of goodness. What is bad in another is like unto your badness. What is good in another is like unto your goodness. And you two are similitudes only a little removed.

The foundation of our political edifice rests on the solid rock of political truth—the durable granite of human equality. If we build to this foundation our system will secure equal and exact justice to all, with a resulting civilization such as the earth has never before witnessed.

The battle of liberty is forever being fought. Selfish and dishonorable men there will always be, ready to carry their purposes of personal promotion and aggrandizement at the cost of the rights of the citizen. Always will there be those who, while they shout freedom to the people, will seek to link the chains that bind them.

San Jose, December, 1876.

FAMILIAR TALKS---No. I.

BY LUIP.

"TO TOIL AND TO SPIN."

Looking over a Southern paper not long since, the following passage arrested my attention;

"There are among us now young people who are growing up in that saddest phase of life for the young, "old before their time;" who have to bake and brew, to toil and to spin; across whose fair young brows no shadows should have come, yet their daily lives are harrassed by carping cares and petty anxieties, whose desires are thwarted, whose hopes are baffled and aspirations chilled."

Why should those who have to bake, brew and spin, grow old before their time? Why should household work throw such shadows across their fair young brows? Why should such work be designated as "carping cares" and "petty anxieties" and harrass their lives? Suppose some desires are thwarted, and some hopes baffled, is it more than Northern girls have to bear with? *They* do not become "mere drudges" because they can not have everything just as they wish. Because they must learn to "look well to the ways of their households," they are not looked upon as being ill-treated by Fortune. And if they are girls of good sense, they do not consider themselves mistreated. It was a queer position for the editor of an agricultural paper to assume. He, and those "daughters of the South," perhaps, never heard, or have forgotten that "labor conquers all things," and the motto so often seen—"Labor is worship."

Surely, in most cases at least, the mere fact that one must wait on herself, and others too, perhaps, and learn to do with little, and help keep the home neat and tidy, need not interfere with one's education. True, one may be unable to attend school constantly, and take a long collegiate course when the public school studies are ended; but more really useful knowledge is to be gained out of school than some may imagine. Many of the courses of study pursued in the higher schools and colleges are of no real benefit to those in the humble walks of life. And these grow more in *quantity* every year. Dio Lewis thinks a return to the public schools of fifty years ago would be an improvement. *Then* the child studied the spelling-book, reader, common arithmetic, and the writing-book, thoroughly, and went out from the school with a constitution sufficiently good to enable him or her to work and earn a respectable living, and to attend college in after years, or to gain a good education during leisure hours. Some of the brightest stars in the literary world, and some of the smartest men that ever lived have been self-taught.

But there are two ways of looking at the work that falls to women generally; the American women as a class, I mean, and those especially who have farmer husbands. One is, that duty in itself is a pleasure, and brings its own reward. Another is the idea that some women have that they are fitted for better things than to be, as they term it, mere household drudges. But sometimes the goodman is more to blame than the wife. He is, too often, apt to forget, that his wife is much farther out of the world as

regards society than he is. For him there is the trip to town once or twice a week for groceries or to the post office. And then there is lodge-night, when he is enjoying himself with his friends, she is at home, it may be entirely alone. Then there is such a difference between their works. Every stroke the farmer makes, counts one, in appearance as well as deed. Every day sees new furrows turned, more grain sowed and springing up to tell of work that he has done. And so with everything that he has to do. With the wife it is different. Three times each day the dishes must be taken from the cupboard, placed upon the table, only to be gathered up, washed and put away again. The same floors to be swept, the beds to be made each morning, the clothes to be washed and ironed every week, and patched and darned. It makes no show after it is all done, and if the husband grows careless it is doubly hard; and it is not to be wondered at that so many women seem to have no thought for anything but their housework. That "their lives are harrassed by carping care and petty anxieties," should not be; and it is in the power of every one to remedy it. But of this, I will, with the editor's consent, speak in the future.

ALMOND CULTURE.

For a number of years, almond culture was regarded as a venture in the whole northern portion of California, owing to the prevalence of late frosts, which it was thought must blight the blossoms five years in six at least. The Almond blooms in March or April, and the frosts at that season are frequently quite heavy. But experience has proved that it is the exception—not rule—when the almond crop is seriously injured by Spring frosts.

Extensive orchards of almonds have been planted in this valley within the last five years, and the young trees are bearing exceedingly well.

Through the courtesy of Mr. E. L. Bradley, of San Jose, we took a ride with him to his fine young almond orchard during the harvesting of his first crop. This orchard consists of 2170 trees, covering 10¼ acres of gravelly but rich soil. It is situated near the County Infirmary; was planted in January 1874. The trees were of two years growth in nursery when planted, and are consequently now five years old from the ground. The trees are planted pretty closely—14 feet apart. They will average three to four inches in diameter, and ten to twelve feet in hight, with a finely proportioned form of head. Some of the trees produced three to five lbs. of nuts each; but the average will be about one pound of fine nuts to the tree this year. This is a really good yield for the age of the trees. There is not a finer almond orchard of its age in this part of the State, and we doubt if there is a finer one in the world than this one of Mr. Bradley's. Mr. Bradley's system of culture has been to keep the surface soil clean and light by thorough cultivation. He runs a plow about four inches deep among them; does not irrigate at all, but preserves the moisture that the rains supply for the use of the trees. The roots run deeply, and the growth and healthfulness of the trees show that they have not suffered for want of moisture. Another idea: He has never pruned his trees at all, but let Nature do her own forming of limbs and ballaneing of forms. The results show the wisdom of Mr. B., and of Dame Nature, for the trees are superior to any that have been trained under the relentless knife. There are a few limbs that may be removed with benefit to the tree, but generally, only a slight shortening-in of some leading limbs is now necessary.

We have advocated letting young trees, and old ones, grow without much pruning, and Mr. Bradley's success with his almond orchard is a strong argument in favor of *no*-pruning. It is certain to our understanding that more trees are injured than benefitted by the modern systems of pruning. Had we a young orchard, our prayer would be, Spare it from the professional pruner!

The close planting, is to get a fair sized, well balanced, rather than a very large tree. The object is to get as full a yield from the acre as possible, with the least cost. Trees growing pretty closely together in our windy climate seem to thrive best, as they are sheltered by each other more than when planted at a greater distance.

Next to the public road Mr. B. has planted a row of almond trees only eight feet apart to catch the dust and break the wind from the orchard. This he has also done around a young prune orchard of 2,550 trees set last winter.

In planting Mr. Bradley had holes dug three feet across and as deep, and filled in with surface soil when the trees were planted, scattering the earth taken from the holes over the surface between the rows. His almond trees cost him 30 cts. each, setting out 10 cts. each. The land upon which the trees set cost $120.00 an acre, although it is worth more than that now.

Ten and one-half acres would be

For land.....	$1,260 00
Trees and planting	868 00
	$2,128-00
Call the cost of culture $300 per year....	600 00
Total cost.....	$2,728 00

The nuts raised this year will pay more than the cost of culture for a year. The trees as they now stand will pay as an investment $10 to the tree—that is, they will pay for the next fifty years the interest on $20,000 and the principal besides. This on less than $3,000 invested.

A RETIRED MINER.

Mr. Bradley is not orcharding or farming for a living, but as a pastime. He is one of the few "fortunate miners" who accumulated a pile at the expense of his physical health, by hard work and exposure, and has finally chosen this garden spot of the world for a residence and home. His magnificent mansion in San Jose, erected under his own and wife's direct supervision, shows a degree of taste and good judgment in making a home, as well as the liberal character of the man. Happily, he is one of the few not puffed up by riches, nor vanity but sensible and every-day in thought, sentiment and manner. Would that there were many more of the same sort.

We noticed that his place was well stocked with such animals as he needs, fine Durham cattle, good horses, splendid mules, Berkshire pigs, etc., also the best farming and other tools needed about a farm. His barns are filled with hay, his straw is all stacked and sheltered, and economy worthy of being copied is shown in every department of his farming.

SQUIRRELS.

Mr. B. has had to contend with squirrels bred on his neighbors' lands. They have completely girdled and killed some of his almond trees. He poisons with strychnine in sweet apples. Also catches with traps—the common steel rat traps. These are set in the front of the hole, covered with paper and earthed over, with grains of wheat scattered about. Gophers he fights with traps. He rejoices that there is a law compelling others to kill their squirrels.

DIRECT DEALING.

FROM OUR APIARY CORRESPONDENT.

Ed. Agriculturist:—As bees are quiet and there seem little to say in regard to that industry, and for fear that that little would be out of place in these dry times, I take another theme, and talk of that portion of the farming community who style themselves Patrons, or Grangers. They have just organized a Pomona Grange in this county, and though we know that but few Pomona Granges in this State have met the expectations of their members, we have faith to believe that ours at least will be a success, meeting a want long felt for concentrating the powers of the organization in this county at a single fulcrum and enable us through it to communicate our needs to our fellow workers in the land, and arrange for the exchange of the productions of one part of the State for the produce of another without paying tribute to any one outside of the organization. For instance, some of the upper counties are engaged largely in fruit production, green and dried, while we produce as yet but a small proportion of what we consume. But we do produce *large quantities of honey*, and of a much finer quality than from any other section. Why may not we, through the medium of the Grange, exchange these commodities much to the *advantage of both sections?* I believe we could, and I trust the time is not far distant when the Granges of one county, or section, will make their wants known though some proper channel of communication, and there will be some other section that can fill that want much to the advantage of both. In making these suggestions, I do not claim to advance a new idea, but only that it is one that has not been acted upon, at least with us. Jcs.

Bernardo, San Diego Co., Dec. 17.

Fruit Profits.—Five acres of prunes eight years old, yielded a net profit of $2,000; two acres of Bartlett pears, twelve years old, shipped East, a net profit of $1,300; two acres of prunes dried and packed, a net profit of $900. At the prices paid for strawberries last year, they would net the producer something over $300 per acre; blackberries about $450 to $500 per acre; the plant, which is extensively grown on the garden lands adjacent to San Jose and Santa Clara, will net about $200 per acre; asparagus, also extensively cultivated for the San Francisco market, $200 per acre; grapes, eight years old, from $100 to $300 per acre; currants and raspberries, of which the Santa Clara Valley produces enormous quantities, $300. The cherry crop is the finest in the State.—*San Jose Argus.*

The bust for the Greeley memorial monument was cast at Wood's foundry, Philadelphia. It is of bronze, and of a size proportionate to a figure of about ten and a half feet. The pedestal and base is made of Quincy and Maine granite, bearing a bas relief in bronze, with the following inscription: "Horace Greeley, born February 3, 1811; died, November 29, 1872, The founder of the New York *Tribune*." The entire cost was over $5,000. The unveiling took place last month.

Corn.

To-day the woods are trembling through and through
With shivering forms, that flush before my view,
Then me It in green as dawn stars melt in blue.
The leaves that wave against my cheek caress
Like women's hands; the embracing boughs express
A subtlety of mighty tenderness.
The corn-clopths into little noises start,
That sound anon like beatings of a heart,
Anon like talk 'twixt lips not far apart.
The beech dreams balm, as a dreamer hums a song;
Through that vague warture, expirations strong
Throb from young hickories breathing deep and long
With stress and urgence bold of prisoned spring
And ecstasy of being.
Now, since the dew-plashed road of morn is dry,
Forth venture odors of more quality
And heavenlier giving. Like Jove's locks awry,
Long muscadines
Rich-wreath the spacious forcheads of great vines.
And breathe ambrosial passion from their vines.
I pray with mosses, ferns, and flowers shy
That hide like gentle nuns from human eye
To lift adoring perfumes to the sky
I hear full bridal-talks of brown and green
Dying to silent hints of kisses keen,
As far lights fringe into a pleasant sheen,
I start at fragmentary whispers, blown
Fr m undertalks of leafy souls unknown,
Vague purp ds sweet, of inarticulate tone.

—[Lanier.

When to Paint Your House.—The *Technologist*, a good authority, states that paint applied to the exterior of buildings in autumn or winter will endure twice as long as when applied in early summer or in hot weather. In the former it dries slowly and becomes hard, like a glazed surface, not easily affected afterwards by the weather, or worn off by the beating of storms. But in very hot weather the oil in the paint soaks into the wood at once, as in a sponge, leaving the lead nearly dry and ready to crumble off. This last difficulty, however, might in a measure be guarded against, though at an increased cost, by first going over the surface with raw oil. Furthermore, by painting in cold weather you escape the annoyance of small flies which invariably collect during the warm season on fresh paint.

Population of the World.—But few persons have anything like a correct idea of the number of people in the world, moving around, eating, drinking, running in debt, talking about their neighbors, struggling for life, falling in love, taking quinine, having their teeth pulled, guzzling whisky, chewing gum, wearing out old clothes, trying to make money. In 1870, according to census returns, the total population of the world was as follows;

Siberia, Asia, - - - -	798,000,000
China, - - - - - -	447,000,000
Europe, - - - - - -	301,000,000
Africa, - - - - - -	203,000,000
North America, - - -	52,000,000
South America, - - -	26,000,000

Profitable Crop.—Frank Kleckner reports that on twenty six acres he produced 800 sacks of beans each sack averaging sixty-five pounds. This yeald aggregates one ton per acre and the class of beans produced are quoted at 2½ cents per lb. This brings the returns in gross at $50.00 per acre. The land on which this crop was produced cost less than $25 per acre. What must be the profit to this people another year when all this vast area is farmed judiciously? A climate and soil that will produce in a single year double the first cost of farm lands is certainly an enviable place for the industrious husbandman. The bean crop here reported was not the product of the best land in our valley by any means.—*Lompoc Record.*

Boys and Girls.

The Seed.

The farmer planted a seed,
A little, dry, black seed;
And off he went to other work,
For the farmer was never known to shirk,
And cared for what he had need.

The night came with its dew,
The cool and silent dew;
The dawn came and the day.
And the farmer worked away
At labors not a few.

Home from his work one day,
One glowing summer day;
His children showed him a perfect flower,
It had burst its bloom that very hour,
How, I cannot say.

But I know if the smallest seed
In the soil of love be cast,
Both day and night will do their part,
And the sower who works with a trusting heart
Will find the flower at last.

The Farm and the City.

An old farmhouse, with meadows wide,
And sweet with clover on each ride;
A bright-eyed boy, who looks from out
The door with woodbine wreathed about,
And wishes his one thought all day:
"Oh! if I could but fly away
From this dull spot the world to see,
How happy, happy, happy,
How happy I should be!"

Amid the city's constant din,
A man who round the world has been,
Who 'mid the tumult and the throng,
Is thinking, thinking all day long:
"Oh! could I only trace once more
The field path to the farmhouse door,
The old green meadow could I see,
How happy, happy, happy,
How happy should I be!"

Our Baby.

Do you see our baby,
Sitting in his chair?
Many funny tricks
He plays when there.

Darling little baby,
Oh, so full of fun,
Very soon we hope
That he'll begin to run.

Now sister Rose and I
Must hold each tiny hand,
For our darling baby
Cannot safely stand.

OUR CORNER.

AUNT POLLY'S NEW YEAR GREETING.

JANUARY, the first month, the usher in of another New Year, is here! It always brings a Hppy New Year's greeting. How fortunate it is that the holidays come in mid-winter, to dispel some of the gloom that the storms, winds and frost of Winter always shadow over the earth. How cheerful the smiles are that accompany the gifts, and merry words so freely given by friends during the holidays. Aunt Polly wishes that every day in the year was a holiday, so that only smiles, and good will, and joyful words and looks, and happy faces, could be seen at any time, and everywhere! How happy we should all be then. Well, let us who belong to "Our Corner" have a holiday all this new year. We can make "Our Corner" a happy place of meeting every month, and exchange the gifts of letters and puzzles and joyful words, and let only the sunshine in to show how cheerful we can be. Instead of letting the holidays end with "A Happy New Year," let's commence a year of holidays!

Aunt Polly has lots of presents for all of you, and means to give them to all who write good letters, make good puzzles, and find out the good puzzles. Won't we be jolly! So come on now, every child that wants to be a cousin, and see if your Aunt Polly is not as goood as her word. Try your very best to write nice letters for OUR CORNER, and we will show the older folks that we can make our part of the AGRICULTURIST better than all the rest of it put together.

"Our Corner" goes to press this month before many letters come in. The Editor thinks it rather silly, any way, to take up too much room with our letters, but then, as "old fogy" as he is, he has promised Aunt Polly a liberal amount of space for the present year, and we will fill it, too, wont we? Now send a bushel of letters for next month. Here are the few we have on hand now:

THAT BOY.

I saw him on the street with a cigar in his mouth, and reeling as if under the influence of intoxicating drinks. About ten years of age, with a bright eye and good features, he is a bright lad with very good capacities. What an ornament to society, and what a comfort to his parents when they shall begin to travel the down-hill grade of life—what possibilities are within his grasp!

His father and mother are church-going people in their habits, a blessing is asked at the table, and they partake of communion in the church once a month. Of additional evidence of their piety I am not informed.

The conduct of their son would pain them very deeply if they knew anything of it; but they are in blissful ignorance of his movements of evenings. They know that he is out, but they never dream of haunts of dissipation, of dens of infamy, in which he may frequently be found. Though he is yet in childhood's tender years, he is old in iniquity. Aye, he is able to give expression to language that should burn the cheek of innocence to a blister. At present I withhold his name from the public.

MRS. L. WRIGHT.

A GREEDY FROG.

DEAR AUNT POLLY:—Your "Corner" in the December number is indeed splendid—interesting as well as instructive to us older ones. My neighbor, Mrs. Z, told me such a funny frog story the other day that I am sure your neices and nephews would all like to have a laugh over it too. So I will tell it you, though I wish they might have heard it in her own language, as I did. Did you ever hear that holding a frog in the hands when one has the chills and fever, until the chill stops, will insure a cure? Well, several years ago, she sent one of her two children some two miles in the country for a frog, as her boy was sick with chills. The child brought home five little frogs, one medium-sized and one big bull-frog, in the pail. She set the pail on the shelf in the kitchen until the child should come on next day. About ten at night there was heard such a jumping and thumping among the frogs in the pail! She went to see what was the matter: there sat Mr. Bullfrog in the pail alone struggling with the medium-sized frog half down his throat, trying to make a meal off him. She called for help, and while one held Mr. Bullfrog she pulled young Mr. Bullfrog out; but the five little ones were gone too far down to recover them! Mr. Bullfrog had turned cannibal, and eaten up a whole family at one meal. This is a true story. What effect this glutton had upon the chills next day we did not learn. "JEWELL."

LETTER FROM NATIVIDAD.

DEAR AUNT POLLY:—Not having anything to do, I thought I would drop you a few lines. I will tell you how two of our smart young men went out hunting rabbits and little birds back of Natividad one day lately and got lost, They hunted all day, and night was coming on, and it was getting dark and foggy. It got so dark that they got down on their knees and prayed and bawled forevermore, and shot off their shotguns, and hollered, and got the people of Natividad "skeart," and Gen. H.'s cavalry stayed after them, (it must have been about 9 o'clock at night), and after the cavalry came Capt. J. S., armed with lanterns and cannons. Gen. H. got up in the hills first with his cavalry, (as the hills are only half a mile from town.) Capt. S.'s First Regiment came up in the rear, and the whole command made a halt near by where they supposed the hollowing and shouting came from, (as the sounds were in a deep canyon.) The smart young men saw the lanterns and hollowed for mercy—and kept on shooting. Gen. H. turned his cannon loose and shot in the air, and then they stopped their hollering and shooting. Then Gen. H., and Commander J. P. of the same cavalry, went up to them and made the smart young men surrender—took them prisoners —brought them to Natividad, and sent them home to their respective parients. Gen. H. said that he found C. B. with his hair tangled in the brush, and his companion could not loosen him.

I send my love to all the cousins, and also to Aunt Polly. I wish you all a Happy New Year. Aunt Polly, I have got a pair of doves, the prettiest little things you ever saw.

I am only ten years old. How do you like my writing? One of my friends says she is going to write to you.

BETTIE.

P. S.—Here is one verse of poetry that a little boy taught me to say to my little dog:

I had a little dog,
His name is Nebudcanneczer;
You'd stick a feather in his nose,
And he'd be sure to sneezer.

Good bye, B.

Aunt Polly thanks Betty for her funny letter, but requests her to be sure and not make personal allusions that will hurt any one's feelings. It is easy to cast ridicule upon anyone. But there is nothing meaner than to injure others. We trust our Betty is innocent of such intentions.

ANOTHER LETTER FROM NATIVIDAD.

DEAR AUNT POLLY:—We could not let this day pass without writing you a few lines, as we see that you are publishing letter from the little folks. We are not very smart, as you may think, but I guess we can write just as good a letter as anybody. We ain't got much news to tell you, only that we are not going to have a Christmas tree here in Natividad. The folks here are getting too high-toned, and some are going to Salinas, Gonzales and Santa Rita to enjoy the Christmas trees and trip the light fantastic toe (as school teachers say), and, for our part, we are going hunting goosos to eat New Years. We asked Uncle George to come and eat with us, but he said that Miss —— asked him to go and dine at her dinner party. She was too stingy to ask us to go; but we will get even—we won't ask her to come to our dinner party New Years.

OCK & CHUB.

OUR POETRY.

We had a little dog, his name was Clover,
Fell in the slop-pail, and died all over.
We had a little pig, his name was Jim Brown,
Turned a double somerset and broke his crown.

Aunt Polly thanks O. and C. for their spicy letter, but has had to cut out some of it as a little too rough. Please try to be funny without being rude. There is plenty of room for jolity in this world we live in without being a bit uncouth. Aunt Polly enjoys fun and frolic, but no real good person can admire or enjoy that which is not refined in principle.

YETTA'S POEMS.

Here are two more of Yetta's first poems. Remember, Yetta is only 10 years old, and is going to write better and better till she can make a nice book of poems, with blue cover and gold edges.

MY NELLIE IS DEAD.

My darling, my little Nellie,
His just been laid beneath the earth;
When again I visit the homestead,
No face will greet me by the hearth.

When little playmates together,
We often played upon the green,
She promised me when older,
To be my pretty little queen.

But alas, my darling Nellie,
Will never, never be my bride,
And when my time for death comes,
Ill ask to be laid by her side.

There was sorrow in the household,
When my poor darling Nellie died.
Her father and mother were anxious
For her to live to be my bride.

TO MY BROTHER WHO HAS COME BACK.

Brother, since you came back,
How happy we all feel,
To have our brother beside us
When in prayer we kneel.

Dear brother, how sad you made us,
When you fled from your parental wing,
I know you sought for employment,
And to merit the honor of a king.

But many years must elapse, dear,
Before you will find such honor,
But while you are young be content
At your father's store on the corner.

To grow up good and honest
Is better than all king's wealth;
I hope you'll have a happy life,
And with it childhood's health.

LETTER FROM SALINAS.

DEAR AUNT POLLY:—This is the second time I have written to you. The last time I wrote a short letter; this time I will try to do better. It is now drawing near Christmas. My little sisters and brother and I expect to have a good time. I hope you will enjoy Christmas and have a good time, too. Dear Aunt Polly, I hope you are getting stronger now. The last time I wrote to you, you were sick. I enjoy to sit and read the "Corner," when the AGRICULTURIST comes. I am going to send 50 cents to get the chromo called "The Refreshing Surprise." Don't forget our address, Salinas City, Monterey Co., California. Aunt Polly, I cannot think of anything more to say in this letter. I will try to do better next time. I am still ten years old. I hope I will see this letter printed in the AGRICULTURIST. I have blotted this letter very much, but I guess you can read it. Please excuse the blots. Mamma has lots of turkeys and I guess we will have one for Christmas. My

father is waiting for the rain to come, as he has a large farm to cultivate. I was trying to make out some of the puzzles, but I cannot. I remain, as ever, your neice, Annie Williams.

December, 1876.

LETTER FROM LIVERMORE.

Dear Aunt Polly:—I am not much of a letter-writer, but I do like to make puzzles, and guess them too. The answer to Fannie Barkway's enigma is, "The Consolidated Virginia;" to Yetta's, "You are Extremely Handsome." I would suggest that she change the first Y to U. The answer to the square puzzle is, "John Underwood, Andover, Massachusetts." It is not original—I have seen it before. I send an enigma.

Tom Clark.

PUZZLES NOT ANSWERED.

Chromos have been sent to Tommy and Mary Clark, for puzzles which they sent to Aunt Polly which none of our little cousins could answer. Any others who have sent puzzles that have not been answered, or who are entitled to chromos, should send for them at once. Aunt Polly wants every one of the cousins to work for these premiums, and to get what they are entitled to.

A GREETING FROM THE EDITOR.

Dear Children:—The Editor has so many pressing cares that he hopes the children will excuse him if he doesn't write much for their department. But as Aunt Polly has at our expense got a fine picture of herself engraved for this New Years number, and bids you all such a nice "Happy New Year," we thought we would get our artist to make a real nice picture of us—that is, we, the Editor. We think the artist has rather flattered Aunt Polly, as she is not quite so handsome as the picture makes her, but as she is a little proud, it's all right, any way. Now as we have to be gone into the country for a few days, we will get our printer to attend to putting in our picture, which, by the way, is not finished as we leave; but as our artist is first class, we have no doubt he will flatter us, as well as Aunt Polly. So now, hoping you will be pleased with our picture, and wishing you A HAPPY NEW YEAR, too, good bye all.

The Editor.

THE PRINTER'S GREETING.

Dear Children:—The Printer now has a word to offer. The Editor is away and his artist took a good picture of him as he was going out of the office, with his umbrella under his arm, wondering what in the world would become of us all "if it doesn't rain!" Of course the picture flatters the Editor, who, by the way, is extremely handsome (?) He scolded Aunt Polly awfully for calling him "old fogy," and we expect fits for daring to put this in about him. If we only dared we would say more. But here is the Editor's picture, true to nature.

"If it doesn't rain!"

One Help for Hard Times.—To increase the product of one's labor, and make the best use of what is obtained, will be helpful these hard times. The hints and suggestions of intelligent, practical men and women, who devote themselves to study and observation, must be of utility. We do our readers a favor by directing their attention to the *American Agriculturist*, which is now entering upon its 36th year. It is full of information, that cannot fail to be helpful to every family, and to every man, whatever his calling. Each volume gives from 600 to 700 fine original engravings, pleasing and instructive to all classes. Its house plans and improvements, with full particulars of cost, etc., its fearless exposure of humbugs and quackery, indeed its whole make up and reliable character, render it worthy of a place in every household. The publishers supply it at the low cost of $1.60 a year, post-paid, or four copies for $5.40. Orange Judd Company, publishers, 245 Broadway, New York City.

The Annual Register.—We are in receipt of a copy of the *Annual Register of Rural Affairs* for 1877, published at Albany, N. Y., by Luther Tucker & Son, and mailed to any address for 30 cents. It is the oldest (and only) publication of the kind, and contains 150 pages of practical matter, interesting to every resident in the country, illustrated with no less than 140 beautiful engravings, almost all original. We notice particularly a capital article on "Practical Ventilation," which discusses this all important topic in a clear and at the same time scientific manner giving fully illustrated descriptions of all the improved systems.

The *Country Gentleman*, published by the same firm, is one of the best agricultural papers in America.

Stockton, Dec. 9th, 1876.

To the Cal. Farmers' Mutual Insurance Co., S. F.—Gentlemen: Herewith allow me to express my thanks to you the company for the promptness you have manifested in adjusting my loss by fire, which occurred on the morning of Nov. 9th, 1876, and the payment of the same in full, amounting to $650.00. I shall never fail to recommend your company to the farmers of California desiring insurance, as being a fair and equitable company to do business with. Trusting that your company may continue to prosper, and retain the confidence of the public which it so richly merits, I remain, dear sirs, respectfully yours,

Wm. Presbury.

Best Book for Everybody.—The new illustrated edition of Webster's Dictionary containing three thousand engravings, is the *best book for everybody* that the press has produced in the present century, and should be regarded as indispensable to the well regulated home, reading room, library and place of business.—*Golden Era.*

Keep none but the best stock. Poor stock does not pay, and whatever does not pay, makes the owner poorer. A poor milk cow makes a poor owner. Always buy the best cows, sheep and hogs your means will allow, and then give good feed and the best care, and thus avoid becoming poor by means of poor stock.

The market for our farm products is widening. Since last July American cattle have been received at Glasgow to the number of from 150 to 250 head per week. Meat, also has been imported there regularly, the average quantity being 150 carcases weekly.

To Our Subscribers,

—AND—

TO TEACHERS.

BUSINESS COLLEGE.

A Day and Boarding School for Both Sexes.

The THIRTIETH SESSION OF THIS INstitution will commence January 8th, 1877.

PROF. A. C. LAWSON,

Late of Alabama, an experienced Teacher and thorough Scholar, has become one of the joint partners of the School—thus rendering it practically co-operative.

The Course of Study is extensive and thorough, including Ancient and Modern Languages, Higher mathematics, Music, Drawing, Painting, etc,

THE BUSINESS COLLEGE

Occupies a large and commodious room separate from the main Institute buildings, and possesses all the necessary conveniences and facilities for imparting instruction.

The Course of Study in this Department includes Book Keeping (Single and Double Entry), Commercial Calculations, Correspondence, Penmanship, Actual Practice in Wholesale and Retail Merchandising, Jobbing, Commission, Banking, and Telegraphy.

Students of the Business College have the privilege of the other Departments without additional charge.

Teachers, desiring to prepare for examination, will find special opportunities at the Institute.

Persons whose early education has been neglected, can receive private instruction.

Agricultural Implements

SEASON OF 1876-7.

THE FARMERS' UNION

AT SAN JOSE,

And Branch Stores

Are now selling all the most superior and desirable Seed-time Implements, among which we call special attention to

The John Deere Gang and Single Plows,
The Gorham Seeder and Drill,
The Fon Du Lac Harrow,
The Nash & Cutts Separator,
The Cahoon Seed-Sower, Etc.

The GORHAM has proved to be the Drill best adapted to California Farming; is just the thing that every good farmer should have.

The Fon du Lac Harrow is the best, made of Wisconsin oak, angular steel teeth, free couplings—needs only to be seen to be appreciated.

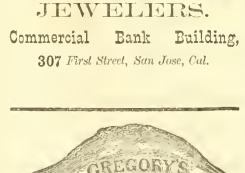
JEWELERS.

Commercial Bank Building,

307 *First Street, San Jose, Cal.*



My Annual Catalogue of Vegetable and Flower Seed for 1877 will be ready by January, and sent FREE to all who apply. Customers of last season need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed house in America, a large portion of which were grown on my own seed farms. Printed directions for cultivation on every package. All seed sold from my establishment warranted to be both fresh and true to name; so far, that should it prove otherwise I will refill the order gratis. As the original introducer of the Hubbard and Marblehead Squashes, the Marble head Cabbages, and a score of other new vegetables, I invite the patronage of all who are anxious to have their seed fresh, true, and of the very best strain. New Vegetables a specialty.

Real Estate Agents

—AND—

GENERAL AUCTIONEERS,

312 Market St., San Jose,

HAVE FOR SALE, IN SANTA CLARA AND adjoining Counties, a very fine list of Grain and Stock Farms, improved and unimproved, in in tracts from 10 acres to 10,000, which they offer upon easy terms and at low prices; also, a large list of Business and Residence property in Santa Clara and San Jose. We append a partial list. Having resided in this county for 26 years, and being thoroughly posted as regards Real Estate Values, we respectfully solicit all in search of Homes, Stock, or business of any kind to give us a call.

10 Acres near the town of Santa Clara, with fine House and Out-buildings, good Orchard, Ornamental Trees, etc. Price, $10,000.

20 Acres of Unimproved Land in the Willows, being part of the Lupton Estate. Price $3,000.

80 Acres, under fence, all in cultivation; has a House of 4 rooms, Barn and Stable-room for 15 horses, good Well, splendid water. Also, 52 acres adjoining, with Redwood House, Barn, etc., good Well; all under cultivation. Price, $35 per acre.

21 Acres of fine land, 3 miles from San Jose, east of Coyote, well enclosed, good Adobe House, Large Barn, etc. Price, $4,000.

38 Acres of fine land, 2 miles south of San Jose, lying between the Monterey Road and the Coyote Creek. The soil is unsurpassed, and the location beautiful. Will be sold as a whole, or in three subdivisions; 22 acres fronting on Coyote, at $225 per acre; 8 acres between the two residence lots, at $300 per acre; 16 acres including the fine improvements for $5,000.

60 Acres of as fine land as can be found in the county, with fine improvement. Will sell low if called for within next 90 days; must be sold in that time. Situate one mile from Lawrence Station, S. P. R. R.

18 Acres fine Vegetable Land, 3 miles southeast of San Jose, on east side of Fully Road; has a Dwelling (of the old two-story house); Barn, etc.; Orchard and Vineyard of 5 acres; Cows, Wagons, Farming Implements, etc. Price of whole, $4,500.

1,000 Acres of fine Grain and Fruit Land, located near Los Gatos; will be sold in tracts to suit at from 40 to 1000 acres. Terms easy; prices low; must be sold within 90 days.

76 Acres rolling land 8 miles west of San Jose, adjoining Reynolds' farm. Small house of 3 rooms; nice running stream of water; well fenced; with plenty of wood on the premises. Price, $2,800.

108 Acres land on San Jose and Santa Cruz road, near Los Gatos, 5 miles from San Jose; excellent land, and will produce anything; improvements consist of a dwelling which cost $2,000, a good barn, also orchard and vineyard; good well, wind mill and large tank. Terms, ½ cash; balance on time. Price, $35 per acre.

83 Acres fine land 6 miles west of San Jose, near Lawrence Station; well improved. Price, $400 per acre, on reasonable terms.

290 Acres 5 miles west of Gilroy; 30 acres vineyard; 10 acres orchard, all kinds of fruits; 3 living streams of water; all under fence; has a good house, barn and other out-buildings; wine cellars. Terms easy. Price, $10,000.

Stock farm of 2,000 acres, enclosed with brush fence and natural boundaries, located about 10 miles east of the Penitencia house, near Bennett's stock farm; well improved; has a good dwelling, barn, corrals, etc.; 80 head of American cattle, 45 of which are cows, balance one and two year olds. Terms easy. Price, $4,000.

42 31-100 Acres land on the road Guadalupe Mines, near the Los Gatos road, adjoining lands of F. Richmond. Terms easy. Price, $3,000.

242 Acres fine land, near San Jose; will be sold on a long credit. $5,000 cash; balance in 6 years, equal annual payments, with interest at 10 per cent per annum.

200 Acres of excellent fruit and berry land near Santa Clara depot. Price per acre, $300.

200 Acres in Alameda county, on west side of county road leading to Oakland, about one mile from Warm Springs, near Mission San Jose. It is fine black loam soil, well fenced. Has a good house and barn, etc. Price, $40 per acre; one-fourth cash; balance in one, two and three years, approved paper bearing one per cent. interest.

500 Acres of extra fine grain land 5 miles southwest of Watsonville and 1½ miles from shipping point, will yield 40 to 60 bushels per acre. Terms to suit purchasers. Price, $50 per acre.

160 Acres of pre-emption claim 35 miles southwest of Salinas City, 10 miles west of railroad terminus. Small house, good fence, out-houses, etc.; with an outside range of 800 acres, all finely watered. This is one of the finest hay ranches to be found in the country. Price, $1000; or will exchange for San Jose property.

160 Acres of fine timbered land located just on the line between Santa Clara and Santa Cruz counties. No piece of property on Santa Cruz mountains to excel it. Price, $5,000.

120 Acres fine land adjoining village of Saratoga; enclosed; title perfect. Price per acre, $50. Also, a farm of 160 acres 1½ miles south of Saratoga; good dwelling, barn, orchard and vineyard. Price, $4000.

81-Acre farm 4 miles northeast of San Jose; is a choice piece of land, with house 18x24 feet, small barn, etc. Price, $7,000.

Something New, Ladies!

Just What You Want for Yourself and Children.

DON'T FAIL to SEND FOR a PATTERN

Comfortable Combination Clothing.

THESE SUITS ARE CALCULATED FOR Healthfulness, Comfort and Convenience, and will fit the most fastidious person. Explanations accompany each Pattern. Patterns of four different styles of Suits are now supplied, viz.:

New Price List:

1—Cal. Combination Suit, for flannel....55 cts.
2—Combination Suit, Muslin..... 65 "
3—Excelsior Suit, Muslin,..... 80 "
4—Bodice with Yoke..... 65 "
5—Yoke Band for Skirts..... 25 "

THESE STYLES OF UNDERCLOTHING FOR Ladies have been found by all who have used them, the most convenient and comfortable, as well as economical of any now in use. Models were exhibited and attracted much commendation at the late Fair.

Patterns can be had by applying to **Mrs. Herring**, east side of Ninth street, between St. John and St. James streets, San Jose, (where samples can be seen,) or by addressing

C. C. C. Company,

Box 686 San Francisco.

This reform underclothing has been worn by the Editor's wife and children for the past two seasons, and is certainly superior in points of comfort, healthfulness, and economy of wear and material of any ever invented. They are the invention of a California lady who makes every pattern her-self and writes full directions upon each. No family that once tries these styles of clothing will ever go back to the others.

Gloves Gloves.

THE ANGORA
ROBE AND GLOVE CO.,

OF SAN JOSE, CAL.,

Capital Stock $50,000

C. P. BAILEY, President.
JACKSON LEWIS, Secretary.
JOHN W. HINDS, Treasurer.

THIS COMPANY is making a specialty of manufacturing all styles of

GLOVES, ROBES, MATS, RUGS,

Lace-Leather and

PEBBLE GOAT LEATHER,

FROM

Angora Goat Skins.

They claim for the gloves

1st. They are cheaper than buckskin gloves.

2d. The skins are tanned with the grain on, and are very nearly water proof, and when, from long exposure, they are wet, they dry out perfectly soft—as good as new.

4th. For a harvest glove they have no equal

They also manufacture all varieties of buckskin Gloves and Mittens as good as the best.

The Gloves, Robes, and Lace-Leather manufactured by this Company have taken First Premiums in 1876 over all competitors at the Nevada State Fair, California State Fair, and Santa Clara County Fair.

CAUTION.—Certain unprincipled parties are manufacturing gloves from sheep-skins, and stamping the same "Goat Skin Gloves."

☞ Look for our trade mark, stamped in the glove, before purchasing. ☜

For sale by the trade generally.

SPECIAL PREMIUMS.

For 4 New Subscriptions—A Gond, Second-hand Five-Keyed Flute, well worth $5.

For 6 New Subscriptions—Darwin's Variations in Domestic Plants and Animals. New, valuable work, 2 volumes. Price $6.

City Gardening.

GARDENING FOR FEBRUARY.

VEGETABLE GARDEN.

If not already done, prepare the soil at once for the garden. Stiff soil should be covered with sand, where obtainable, and at any rate should be very completely pulverized several inches in depth, and well manured. Plant peas, onions, beets, carrots, parsnips, lettuce, cress, radish, turnips, etc., where they are to grow, also potatoes, and set out cabbage and cauliflower plants if you have or can get them. If not, start some in beds at once. Also, start tomatoes, egg plants, sweet potatoes and peppers, in beds or boxes, where they be well sheltered from frosts. Delay planting corn till the middle of March, and squashes, beans and cucumbers and melons until near the first of May, when there is little danger of frost. Then tomatoes, etc., can be transplanted with safety.

FLOWER GARDEN.

If not already attended to, plant out your flowering bulbs, such as lilies, gladiolus, amaryllis, tuberoses, dahlias, peonies, agapanthus, etc. Trim back your geraniums for a new start, also petunias, and other half-hardy perennials. Cut back rose bushes at once. Divide up the sweet-williams, pinks, chrysanthemums, violets, etc., and give enough room to spread in rich soil. This is an excellent season for dividing most plants at the roots, and to start cuttings in sand in a moist sheltered place, in garden beds or in boxes. Plant hardy and half-hardy annuals of all kinds. We refer you to catalogues, which can be had for the asking, for the varieties you want. But don't forget that a few showy varieties are better than too many kinds. The alyssums, asters, balsam, cockscombs, daturas, amaranths, nasturtiums, phlox, portulacas, salvias, zinnias, etc., etc., are especially fine in variety. If you did not plant biennials and perennials last fall, plant at once, and they will give you some flowers this season; if a little late they will make a fine show when many others are out of bloom, if they get plenty of water and care.

Make war against weeds of all kinds; hoe or pull them out. Also, look out for slugs and cut-worms, and other insects. Don't crowd too many plants together. Where too thick, thin out. Group together for color and effect, but do not plant tall growing plants so as to hide the short ones. Do not give very much water until hot, dry weather, but let the plants grow in a light, dry, warm soil, during spring weather. This is important.

THE FRUIT GARDEN.

Trim your blackberry, raspberry, currant and gooseberry bushes, if not already attended to. Delay pruning grape vines until danger of frost is past. Thin out and hoe your strawberries. Grape and other cuttings may be planted this and next month, and all small fruits be divided at the roots and transplanted, when desirable to increase their number. Cut scions now for grafting, pack in sand in boxes, keep under shelter, and use in March or April. Nurserymen rootgraft young trees and small plants this month, and until May. Scions saved now in sand will keep till June, as will cuttings of most kinds.

This should be a busy month in the garden. Overhaul your house plants, re-pot all that do not look thrifty, replacing the soil with fresh, rich loam. Start hanging baskets. Chinese primroses and French violets, with wild strawberries, lobelias, sedums, madeira vines, smilax, ivys, wanderering Jew, stone crock, and many other creeping plants of fine foliage, in fact almost any good plants look fine in hanging baskets. Moss and ferns should be used also when obtainable.

ANGORAS vs. SHEEP DURING A DROUTH.

While the sheep suffered and much loss was sustained during the late short season of drought, the Angoras got along as well as ever, and were fat, with plenty to eat upon their natural ranges. The reason for this is plain. The sheep is a grass eating animal, and the grass being annual, gave out. The Angora is a brousing animal, subsisting largely on herbaceous shrubs. It can live independently of grass, while a sheep would perish upon the same range.

In this respect it is more nearly related to the deer and giraffe. Its flesh also resembles the deer's, and is more like venison than mutton. There is a similar difference in its habits from the sheep, as the camel is different from the horse. The camel is a shrub cater, the horse a grass eater.

There is an immense deal of feed on this coast suitable for the Angora. The many uses to which the beautiful fleece, the pelts and skins can be put, are constantly increasing, and the price of the skins and pelts are advancing. Lately the Angora Robe and Glove Company, of San Jose, have added whiplash braiding to their industries, and they are now tanning the real pebble kid for gloves, etc. The fleece of pelts make the best dusters in the world—superior to feathers for all nice furniture, etc.

The Company is selling all the gloves, robes, etc., as fast as they can make them.

Another industry is now inaugurated, and will in future be pushed right along. This is the canning of Angora venison. Heretofore there has been some difficulty experienced in disposing of the meat to butchers at paying rates. Now Mr. C. P. Bailey has demonstrated that the meat can be put up in cans and sold at good prices. This will give an increased value to these animals. When once popular, the Angora venison will be in great demand. We have eaten of the meat at many a meal, and must say that we prefer fresh Angora meat to mutton. There is no healthier meat, or sweeter, cooked in any way.

SHEEP—STRAW—STOCK FARMING.

During the late winter drought many thousands of sheep perished from hunger. The grass upon the ranges gave out, and no provision had been made to feed them with either hay or straw. There is annually enough straw burned by farmers, to get rid of it, to winter all the sheep in the State were it properly stacked and saved for that purpose. A little co-operative understanding and arrangement between stock men and grain farmers would benefit both parties. Every good grain farmer should save his straw. Well stacked it will last good a dozen years, and feed his own or somebody's stock in time of need. Every owner of live stock upon large ranges should make arrangements with some convenient grain producer to have the straw saved for the use of his stock. Of course a still better way is for every farmer to diversify his farming with grain, hay, stock, etc., and thus economically manage his affairs. Only the best stock pays much anyway, and where each farmer keeps a few head he can have the best, and also best conduct his farming to his own advantage.

CHIPS FROM CORRESPONDENTS

Mr. Woodward, of the Mountain House, Contra Costa county, has perfected a model of a machine for loading and unloading vessels with sacks of grain or other material, coal, lumber or heavy timbers. The work is accomplished by means of a geared belt moving upon rollers. The power may be applied at either end of the belt, or at any convenient point, and the machine can be readily adjusted to convey cargo to or from the deck or hold of a ship or barge at almost any angles less than perpendicular. Your correspondent was favored with a private exhibition of its capacity and adaptability, whereat minture sacks of wheat, liliputian sticks of timber, were rapidly conveyed from imaginary barges to the holds of imaginary ships on docks, and vice versa. The inventor, who was formerly captain of a bay and river steamer here, claims for his method, economy of time, labor and power, over any others now employed for taking or discharging cargo of the kind above mentioned, or for storing the same in elevated places, or removing therefrom. It is understood that certain parties have become interested in Mr. Woodward's plan, and will test it.

C.

"If some ingenious misanthrope should set about devising a place of torture far a fellow being, a place forlorn, where not a blade of grass nor living, shrub nor green thing should be, where neglect, decay and dry-rot should reign, and solitude and desolation combine to crush the spirits, strangle hope and induce the keenest pangs of remorse, a place where every object and prospect would call to mind and fearfully magnify some misdeed or folly of the victim's past life, and preclude the faintest hope for repentance or forgiveness, a place where his meat should be Pharoah's lean kine, his Mocha bilge water, and his consolation the weed of bitterness, so that he might hate all human kind—himself most of all, in short, a place of mental anguish and soul's torment; still, in the writer's opinion the misanthrope's ingenuity and malignity could not contrive anything comparable to a California second-rate rural hotel in a droughthy season. MARTYR."

"Martyr" might have added: Where charges are exorbitant in proportion to poorness of accommodations, and unless the visitor will treat all hands to vile whisky, he is counted no gentleman, and is open to insult and abuse.—[ED.

From Bishop's Creek, Inyo Co., a subscriber writes: "We have a fine little valley here in this remote corner of the country, where farming is principally conducted by main strength and awkwardness, and we have the best market for everything we raise that I know of on this coast."

The Alden fruit drying establishment at San Lorenzo, owned by a company composed of Messrs. Meek, Crane, Lewelen, and others of that vicinity, was not in operation last season. The establishment is located in the heart of a famous fruit region. The expense of the Alden process of curing fruit, together with the low price for the product, coupled with the fact that green fruit so near the market brings ready sale, is the reason why.

C.

J. W. Dougherty reports that S. B. Martin, John Jonston and himself, of Murray township, Amador Valley, have imported nineteen studs from clydesdale, Scotland, and that they have upwards of three hundred half-breeds, three-fourths, and a few full bloods each, also four or five young studs, for sale. They ought to advertise.

C.

Stop!

Stop depreciating property and labor, and appreciating debts. Do justice to the debtor, and no injustice to the creditor. Stop the piracy of making the commodity a debt is to be paid in, impossible of being obtained. Stop the conspiracy that has been going on for the last few years, of turning this great land and its noble men and women over into the hands of a few bankers who control the gold of the world. The scheme is too murderous of the rights of men to be tolerated any longer. Stop passing laws by Congress that only a few desperate rascals know anything about, the others sitting like basswood men, while the crime against the country is being perpetrated. Thus it was with the demonetizing of silver. Stop all this —stop this villainous law-making!"

☞ See the notice of arrival of a carload of King's Boilers and Engines. Prepare for irrigation, by getting one.

EDITORIAL NOTES.

An Interest in the CALIFORNIA AGRICULTURIST for sale. Apply to or address JOSEPH PERKINS, 406 Market Street, San Francisco.

See our December and January numbers for instruction in tree planting, etc.

Beatrice Cenci.—To accommodate many new subscribers we have made arrangements with the Cal. Art Pub. Co. to continue the premium certificate No. 3 to April 1st, 1877.

Selfish Interests control the wisdom and reason of most persons—else smart men are generally fools. The San Francisco Chamber of Commerce claims to represent the intelligence of the business men of the Pacific Coast. At a single meeting they passed the two following resolutions. The first we think a sensible one, but the last in the interest of Shylocks, is totally at variance with it, and both together mean just nothing at all:

Resolved, That the introduction of legal tender notes as a uniform currency is especially recommended for consideration.

Resolved, That in the opinion of this Chamber the interests of commerce and the prosperity of the country will be subserved by maintaining gold coin as the sole standard of values in all transactions above the sum of $5.

First blowing hot and then blowing cold,
They pray for legal tenders, but hug the God of Gold!

While there has been less than four inches of rain, up to February 1st, for the season, in San Jose, there has been ten inches in the hills ten miles distant. The same rule will apply to other districts. But the rain-fall in San Jose is above the average in the grain growing districts of the State. Fine, warm weather, heavy dews at night, and no drying, cold winds, are all favorable to rapid growth of grain and hay crops. These conditions may continue, and occasional rains insure fair hay and light grain crops. But the chances are, that there will be but little grain and light hay crops. It is always wise to hope and work for the best but be prepared for the worst in doubtful seasons like the present.

Hops.—A correspondent in Elhi, Washington Territory, informs us that section is a large farming district, and that two-thirds of the farmers are raising hops. The great hop growing districts East are in Western New York and Wisconsin. The prices for the last year have averaged 27 cts per lb. In 1875, 60,000 bales of 200 lbs. each were exported. The crop of 1876 will exceed that crop, and pay growers $250 to $300 per acre. Owing to the prevalence of disease in Europe and the Eastern States, hop growing is a precarious business, one year with another. But on this coast, and especially in Washington Territory, the yield is very large, the vines healthy, and hops very superior.

As there is more speculation and fluctuation in hops than in any other product, there is more need of producers to form associations, and to use every means to keep posted, so as to control prices, instead of being controlled as heretofore. The importance of this matter is very apparent, and should be strongly urged upon producers. The production of hops in the United States, according to the census reports of 1870, was nearly twenty-five million pounds, the State of New York producing about seventy per cent. of the whole, Wisconsin nineteen per cent., Michigan three per cent., California two and one-half per cent., Vermont two per cent., Minnesota and Maine one per cent each, all other States about one and one-half per cent.

With a batch of new subscribers from Petaluma comes a cheering letter, which reads thus:

"We have had a fine rain; a few more like it will give us good crops this season. Our Grange is making some good moves on the currency question,—it ought to have been discussed by all the Granges years ago.

FREEMAN PARKER.

That's just what we think.—ED. AGR. CULTURIST.

ANSWERS TO QUERIES.

ASPARAGUS ROOTS.

ED. AGRICULTURIST: Our Redwood friend, M. E. O. W., can get all the Asparagus roots, 7 years old, desired, by conferring with the writer. It is indeed a luxury on the table, and I discover she knows how it should be prepared, a secret I have taught many, and one that is still unknown in restaurants. It would surely become more extensively cultivated in farm gardens, if all the farmers with their wives and grown up sons and daughters were to happen around and dine with our friend some day when she had asparagus for dinner served up in the way she knows so well.

POLAND CHINA SWINE.

Mr. J. Rathgeb can learn all he desires, and I think, procure the desired stock of hogs by conferring with Messrs. Culver & Merrill, San Gregories, San Mateo county, as they imported what was reputed thoroughbreds, direct from Ohio. Am sure they are as good as any, though I don't believe that a thoroughbred exists in any kind of stock.

WM. S. DOWLING,
Half Moon Bay, San Mateo county.

The Pacific Specimen, by Marder, Luse & Co., type founders, San Francisco, is a beautiful sheet, and ably edited by an enterprising firm.

Some People seem to think that it costs nothing to run a paper—and they pay up accordingly. We have paid out for the one item of postage alone over $60.00 since January 1st, all within one month.

Rainfall.

Following is the rainfall for this section to the end of January for the present season, as kept by Mr. Ethell, of San Jose Bank Building:

Sept.	16	.01 inches
"	29	.09 "
Oct.	16	.50 "
"	17	.06 "
"	18	.14 "
"	27	.14 "

To find the number of plants for an acre at a given distance, divide the number of square feet in an acre by the number of square feet given to each plant.

To find the circumference, multiply the diameter by 3.1416.

To find the diameter, multiply the circumference by .3183.

4 inches is a hand for measuring horses.
6 feet is a fathom.
3 geographical miles is a league.

Scientific.—Herbert Spencer sends the following conundrum to the readers of the CALIFORNIA AGRICULTURIST:

Can the oscillations of a molecule be presented in consciousness side by side with a nervous shock, and the two be recognized as one?

The only clue the author gives is, that feeling and nervous action are two faces of the same ontological something.

A prizie will be given for the correct answer.

☞ Please notice the advertisement of the sale of the entire Avenue herd of Short-horns. This is the most valuable herd in California, or on the Pacific Coast. They were brought here by experienced breeders, not as a speculation, but as a permanent enterprise. Two of the partners have since died, and Mr. Jones and administrators, have to sell to close up affairs. No such opportunity has ever before offered to secure the finest pure bred stock in America.

NEW PUBLICATIONS.

"Ishmael, or In the Depths," is the name of Mrs. Emma D. E. N. Southworth's best work, just published in book form, for the first time, by T. B. Peterson & Brothers, Phil delphia, Pa. It is having an immense sale. It is one of the most fascinating stories. The life of "Ishmael Worth" as here portrayed, is a guiding star to the youth of every land, to show them that there is no depth of human misery from which they may not, by virtue, energy and perseverance, rise to earthly honors, as well as to eternal glory. The story is founded on the life and career of one of the noblest of our countrymen, who really lived, toiled, and triumphed in this land and by his own energy arose from the deepest obscurity to the highest fame. "Ishmael" is published in a large duodecimo volume, of over 700 pages, bound in morocco cloth, gilt back, price $1.75, and is for sale by all booksellers, or copies of it will be sent to any one to any place, at once, on their remitting the price of it in a letter to the publishers, T. B. Peterson & Brothers, Philadelphia, Pa.

"Harper's New Monthly," and "Scribner's Monthly," are upon our table; both first class and all the better for the rivalry for superior excellence.

"The Phrenological Journal and Science of Health," combined, is a most excellent magazine; only $3.00 a year. Who can afford to be without it? S. R. Wells & Co., New York.

"Ropp's Commercial Calculator," is a work that should be in the hands of every business man and farmer. The art of reckoning is simplified, and a new system of tables shows at a glance the value of all products, wages for any time, measurements of everything, etc. Price 60 cents to $2, according to binding. For copy, address, C. Ropp, Jr., Bloomington, Ill.

"United States Newspaper Directory," containing names of all newspapers and other periodicals published in America,—a valuable hand-book for business men everywhere. The most compact, concise and best arranged work of the kind ever gotten up. For a copy send $1 with this notice to C. A. Cook & Co., Chicago, Ill.

"Vick's Floral Guide," quarterly 25 cents a year, is the best and cheapest thing of the kind in the world. The first number of the current year is a splendid number. Everybody should have it.

"Mr. Gregory, the Marblehead, Mass., seedsman, sends out a fine free Catalogue of his choice vegetable seeds and other valuable matter. See his advertisement, and send for one.

"Elocutionist's Journal," published quarterly by Jesse Haney & Co., 119 Nassau St., New York, contains late and excellent extracts from popular writers, dialogues, humorous declamations, anecdotes, etc., suitable for elocutionary exercise. Just the thing for teacher's public entertainments. Only 40 cts. per annum.

"Fragaculture."—Felix Gillett, of Nevada, Cal., has written a very good work on the cultivation of the strawberry. From what little we have examined the work we feel able to recommend it as a practical guide for all who would cultivate this delicious fruit for the table.

"The Pioneer," is a new weekly publication, the organ of the Santa Clara County Pioneers, filled with interesting reminiscences, a cheap and popular journal, ably conducted, by Alex. P. Murgotten, San Jose. Terms, $2.50 per annum.

Poetry.

To My Wife,

On the Anniversary of Our Boy's Death.

BY SETH HOLMES.

THE following lines were written from the depths of woe by a gentleman seventy years of age, who has laid his boy, the hope of his life, in a drunkard's grave, "murdered," as he expressed it, in a private note to us, "murdered by the rumsellers."

Come sit thee down to-night, wife,
And draw thy chair to mine;
My soul so sad to-night, wife,
Needs now that love of thine;
For thou in all life's troubles, wife,
To me hath been a guide,
To cheer me when great sorrow came,
My own sweet, darling wife.

Then sit thee close beside me, wife,
And tell of years gone by—
How in the rosy morn of life,
Our hearts with hope beat high,
And children to our cottage came,
Rich blessings to bestow;
But, darling wife, those happy days
Were in the long ago.

Since then we've seen, my dear wife,
Hope's brightest visions fade,
And one we loved so well, wife,
In manhood's prime was laid
Where the weary rest in quiet, wife,
Free from the tempter's snare;
But God will judge the wrong, wife,
Let whisky men beware!

Our staff and stay has gone, wife,
But still we'll hope and try
Our duties to perform, wife,
And in the by and by
We may together go, wife,
And meet our darling boy,
Where heart will throb to heart, wife,
Where nothing can annoy.

I see your tears are falling, wife,
Your mother-heart has bled—
'Tis better as it is, wife,
That our dear boy is dead.
They can no longer harm him, wife,
His spirit now is free—
And in a few more years, wife,
He'll welcome you and me.

LOWER LAKE, January, '77.

Plow, Hammer and Pen.

From the West leaps out a thunder shout
That thrills the nation's heart—
The plodding chief and the legal thief
Grow white in the rabbit mart;
And shameless fraud that walks abroad,
And rules with an iron hand,
Whose ne'e are thrown from zone to zone
Over all the tortured land;—
All the legionry of Monopoly
That grapples the people's life,
Things foul that feed, with insatiate greed,
And fatten on peace or strife,
Now blanch and cower at this mighty power
Which come to judge and smite—
Hurrah for men of Plow, Hammer and Pen,
Who lead in the battle for Right!

When war's fierce fray had swept away
Our sons at the cannon's mouth,
And their countless graves, like Red Sea waves,
Had billowed the fields of the South,
We fondly thought they had fallen and fought,
That traffic in men should cease,
But we are sold and bartered for gold
In the devil's marts of peace;
The slaves of slaves, of huckstering knaves,
Whose cunning devours our toil!
By Heaven at length they shall feel the strength
Of the tillers of the soil.
Hurrah for the Men of Plow, Hammer and Pen
Whose limbs no gyves can bind—
That, was a fight of thew and might,
But this, is the fight of the mind.

We've headed the wood's grim solitudes,
We've buried the waste in flowers,
Woo'd the wild earth into fruitful birth,
And 'couched her in fairy bowers,
Till the young wind rolled over seas of gold
And died in the fragrant hay,
Till the wanton rills, by clatt'ring mills,
Ran musical through the day.
The songs of the birds, the rattle of words
From our children romping about,
The women within, with their household din,
God's beauty and bounty without!
Till the very air seemed pulpable prayer,
And our spirits refreshed;
Till, when the day had died away
To a gleam in the mellow west,
We said, "No lord, nor other horde,
Can desecrate our toil,"
And we blessed the land where the toiling hand
Was master of the soil.

But all our dreams were mirage gleams,
Bright phantoms of the sun!
We plowed and sowed, we reaped and mowed,
But when our worn was done,
The spoiler came, in freedom's name,
And swept us of all but land.
Came like a thief, with high belief
And law in his dainty hand;
And he, whose breed never filled a reed,
Robs by his polychoric side:
While we and ours, who've woven the hours
Into labor, and love and care,
Can only mope while our crops of hope
Are setting in black despair.
Plow and sow! harrow and mow!
And gather ye clods of the soil,
That cunning and fraud, may revel abroad
And fatten upon your toil.

What avails that he who assails
Is democrat, not lord?
Is't sweeter to live in slavery
To cunning than the sword?
When every right is crushed by might,
All manhood beaten down,
What victim cared if the despot wears
A bonnet or a crown?
Not all the speech the masters teach
Can save the slave from shame.
Away with cant! we freedom want
The substance, not the name.
Oh, liberty, thou soon shall be
Redeemed from city marts,
And proudly crowned, when girded round
With loyal granger hearts!

And now, at length, our giant strength
Shall smite the plotting knaves,
Our deep Reform, lashed by the storm,
Shall 'gulf them in its waves.
Can cent per cent brave our discontent,
Or range his puny crew
To meet the shock, the wild Sirroc,
Of our men of mind and thew?
Hu rah for men of the Plow, Hammer and Pen,
Strong hearts and brain combined;
What foe can stay the headlong sway
Of our mighty march of mind?
Hand clasped in hand we firmly stand,
Secure in our myriad might,
Our battle cry is "Victory,
And God defend the right!"

—[Scanlan.

A Song for the Greenback.

BY MRS S. M. SMITH.

When the soldier starved in the trenches,
And knew, while he waiting lay,
That his children plead, in vain for bread
In his country far away;
While up in the halls of Congress
Stood men who day by day,
Turn back Liberty from blood that plead,
Turned back the soldier's pay;
For the usurers' specious logic
And sophistries false and old,
The army did wait, while the long debate
Went on for the rights of gold,
Till the very gain seemed colored
The roar of the Southern gun,
And the stern command, came up thro' the land,
"Let the greenback's will be done."
Then, the go-enback sped on its mission,
Hurrah! for the Greenback true,
It saved the day, when hope gave way,
It won the victory,
But, sh! when the war is over,
And homeward the soldiers throng,
When at peace we live once, and the land is alive,
With the sound of the workman's song,
Once more in the halls of Congress,
The usurer's voice is bold,
The strife returns, and the greenback burns
At the shrine of the god of Gold.
The hope of the poor may perish,
The workman's song be stilled,
And ruin wide, the land betide,
Till the shylocks vaults are filled,
The busy places of labor
Deserted and silent grow,
And up and down, through country and town,
The tramp and the beggar go,
And the soldier, living, envies
The fate of his comrade, dead,
As weary he waits, at the rich man's gates,
To beg for work or bread.
How long, ye toiling nasty,
Will you bow to the cunning few?
Up! now, and strike, for a freeman's right,
With a freeman's weapon, too.

The ballot, not the bullet!
'Tis the only power to save
From bloody strife, or the slavish life
That ends in the pauper's grave.
Then a cheer for the people's money!
And its foes shall now give way,
It gave us power, in our darkest hour,
It gives us power, to-day.

Men of America.

Men of America, look where you stand:
The curse of monopoly covers your land!
In the north, in the south, the east and the west,
Behold the dread march of this terrible pest!
From the great vital centers of commerce and trade
Monopolies swarm of every grade;
With their network of iron and gold at command
They are crushing the life from your beautiful land:
They are fast gaining power ne'er dream't of before,
Transcending the proud feudel barons of yore.
And all their great wealth—deny it who can!
Is wrung from the toil of the poor workingman.
Men of America, look where you stand!
A darkness of Egypt now covers your land;
A cormorant swarm, from all points they fly,
Like carrion crows they darken the sky.
Soon the soul of your freedom and laws will be fled
And your children be crying and dying for bread.
Men of America, rise in your might,
Cry out for justice, and strike for the right,
By ballot—not bullet—the work may be done,
And shame on the slave who his duty would shun.
Let us all be our cause be honest and true,
And fling to the breeze our Red, White and Blue:
Red for the vultures that feed on the poor,
Blue for our faith in the fathers of yore,
And white for the pure, the honest and good,
Emblem most fit for our great Brotherhood.

"Business" in Mississippi.

Why, howd'y, Mass'r Johnny! Is you gone to keepin' store?
Well, sah, I is surprised! I neber heard ob dat afore.
Say, ain't you gwine to gib me piece o' good tobacco, please?
I's long wid you in Georgia, time we all was refugees.

I know'd you would; I allus tells de people while an' black,
That you's a real gen'l'man, an dat's de libin fac,—
Yes, sah, dat's what I tells 'em, an' its nuffin' else but true.
An' all de cullud people t'inks a mighty heap ob you.

Look heah, sah: don't you want to buy some cotton? Yes, you do;
Dere's oder parties wants it, but I'd rather sell to you.
How much? Oh, jes' a bale—dat on de wagon in de street—
Dis here's de sample—dis is cotton mighty hard to beat!

You'll find it on de paper what de offers is dat's made;
They'll all de same seditions; half in cash an' half in trade—
Dey's mighty low, sah—Come, now, can't you' pe've upon de rates
Dat Barrot Brudders offers; only twelbe an' seben eights?

Lord; Mass'r Johnny, raise it! Don't you knows dat I'se a frien'
An' when I has de money I is willin' for to spen'?
My custom's wuf a heap, sah; jes; you buy de bale an' see—
Dere didn't nebber nobody lose nuffin' off o'me.

Now, what's de good ob gwine dare an' scramblin' de bale?
When people trades wid me day allus gits a bones' sale;
I ain't no hand for cheatin,' I believes in actin' fa's
An' everybody'll tell you dat dey allus foun' me squar'.

I isn't like some niggers; I declar' it is a shame
De way some ob' em swin'les—what, de cotton ain't de same
As dis one in de sample! Well I'm blest sir if it is!
Dis heah must be my brudder's sample—yes sah dis is his.

If dat don't beat creation! Here I've done been totin' your
A sample different from de cotton! I—will—be—consound!
Mass'r Johnny, you mus' scuse me. Take de cotton as it stan's,
An' tell me if your willin' for to take it off my han's.

Shol nebber mind de auger! 'taint a bit o' use to bore,
De bale is all de same as dis heah piece de bagain's tore;
You oughtn't to go pullin' out de cotton dat a way.
It spiles de beauty ob de—what, sah! rocks in dar you say?

Rocks in dat 'ar cotton? How de debble *kin* that be?
I packed dat bale myself'—hol' on a minnit, le' me see—
My stars! I mus' be crazy! Mass'r Johnny, dis is fine—
I'se gone an' hauled my brudder's cotton instead of mine!

The Canesteo Wagoner.

BY JEFFREY GIFFORD.

I.

The forest paths were decked with flowers,
And during the long summer hours
The wagoner drove on;
His docile team, heavy of limb,
Were stout and true, and 'twas his whim
Their backs to ride upon.

II.

The wagon, very large and strong,
Was built great loads to move along;
And, 'mid the green-wood glades,
Slowly and carefully, their way
They threaded each eventful day,
With goods of various grades.

III.

Long ribbons, with their varied hue,
Of crimson, scarlet, brown, or blue,
Swept from the horses' heads;
And happily they trudged away,
Servant and master, both felt gay;
Pleasure unconscious spreads.

IV.

Small tinkling bells, with music sweet,
Kept measure with the horses' feet,
And sounded low, but clear;
While all along the devious way
A wreath of sunbeams fell in spray,
Charms for both eye and ear.

V.

Bright plumaged birds among the trees,
The murmur of the balmy breeze,
And echoing waterfalls,
All lent a passionate delight
To these companions, morn or night,
While on their varied calls.

VI.

On each lapel, upon his breast,
And button-hole of coat or vest,
The wagoner wore flowers.
Aye! blythe as any lark was he,
A life of toil and jollity
Enlisted all his powers.

VII.

The welcome inn was gained at last,
All thoughts of trials in the past
Fled from the wagoner's mind;
He seemed the happiest of all
Who gathered in the tavern hall
To hear how fared mankind.

VIII.

For, with his India silks, as well,
He brought the news, and loved to tell
Of things both strange and true;
Marvels of flood, and field, and skies,
The rustics heard with keen surprise:
Meanwhile amazement grew.

IX.

And, interspersed with drink and song,
These tales were bound the whole night long,
And wonderful they were.
The oftener told—for such is fame—
They grew unlike in form and name;
Such tidings gossips bear.

X.

Along the road were shori relays,
And thus, throughout the long, long days,
The wagoner found rest;
Fresh teams, refreshment and repose,
A place to drink, or smoke, or doze,
And all the while feel blest.

XI.

Along the roads, too, rosy maids,
Buxom with health, won from the glades,
Did shyly look their love.
Handsome was he, erect and trim,
And vigorous in every limb,
Hero beside the dove.

XII.

But times have greatly changed since then,
When, slowly through the woodland glen,
The wagoner drove past.
Steam hurries by with lightning speed,
The telegraph proclaims each need;
Those old days are the last.

PUBLIC LAND MATTERS.

Mr. Lane of Oregon has introduced a bill for the sale of desert lands in certain States and Territories. The bill is so framed as to allow any citizen, or person who has filed a declaration to become a citizen, to take up and hold a mile square of land by conducting water upon the same within three years thereafter, and the privilege of purchasing the same at $1.25 per acre.

"All lands, exclusive of timber lands and mineral lands, which will not, without irrigation, produce some agricultural crop, shall be deemed desert lands within the meaning of this act.

To take effect in the States of California, Oregon and Nevada, and the Territories of Washington, Idaho, Montana, Utah, Wyoming, Arizona, New Mexico and Dakota."

It is wonderful how anxious some of our dear law-makers are to have all the Government lands gobbled up, in large quantities, We can see no good to come from such a law; but discover that there is a great opportunity for land grabbers to get hold of the best remaining portions of our lands which require irrigation, under the pretense of settling and reclaiming the same. There is no honest call for such an act by the people, and they do not need it; but they do need and ask for a law, or amendment to the Constitution of the United States, that will forever prevent the acquisition of Government lands in large bodies by any one person or association.

Mr. Lane has also introduced another bill providing that any settlement made by a person entitled to the benefits of the Homestead and Pre-emption laws shall give him a vested right, forfeitable only by his failure to comply with the law under which he claims; and in case such settlement is on surveyed land, his right to enter a quarter of a section shall date from the actual settlement, but without requiring the papers to be filed until the survey is made.

This seems to be made in order to clinch the nail. Of course it is right only itself, and only wrong in connection with the power to control large tracts of lands.

And now comes

BILL TO GOBBLE UP THE TIMBER ON GOVERNMENT LANDS,

introduced by Mr. Chafee, providing that all citizens of the United States, and other persons bona fide residents of the State of Colorado or Nevada, or the Territories of New Mexico, Arizona, Utah, Wyoming, Dakota, Idaho, Washington and Montana, shall be, and are authorized and permitted to fell and remove, for building, agricultural, mining, or domestic purposes, any timber or other trees growing or being on the public lands of the United States in either of said States or Territories of which such citizens or persons may be at the time bona fide residents. As it now is, many poor men can have homes and business by taking up and purchasing these lands for his own use. Open them up to the despoilers, and a few rich men would control the whole thing. We saw enough of this business in Nevada the three years we were there, to have an idea of the matter.

But the most open-faced and outrageous monopoly of all, on its face, is the bill offered by Mr. Piper of California, "granting to the Alaska Ship-building and Lumber Company the right to occupy and purchase certain lands in the Territory of Alaska upon paying the Government price therefor. For the purpose of encouraging shipbuilding and developing the territory of Alaska, the Alaska Ship-building and Lumber Company, a corporation formed and existing under the laws of the State of California, and its successors and assigns, are hereby granted the right to enter upon and take possession of the island of Kou, situated in the waters of the Territory of Alaska. * * * * And the said Alaska Ship-building and Lumber Company, its successors and assigns, may purchase timber lands upon the shores and inlets of the adjacent waters of Christian and Prince Frederick sounds and Chatham, Duke of Clarence and Kekon Straits, upon giving notice of its intention so to do, describing therein generally the lands and giving security for the payment of the expense of making the necessary surveys, and upon the completion and return of such surveys, paying for such land one dollar and twenty-five cents per acre; such purchase to be made from time to time and in such quantities as may be required."

Here is a grand attempt to monopolize a whole section of valuable country under a most shallow pretense, which would virtually exclude any other person or company from "ship-building" in that Territory. The introduction of this bill by Mr. Piper should consign him to a political grave. What right-thinking man can ever vote for him again? It is time that the people watch the acts of Representatives and Senators, and stamp each with a seal of merit or demerit as each deserves, irrespective of party affinities. Not another acre of Government lands should ever be voted away from the people under any pretense whatever. Leave it open to honest pre-emption, and throw every guard around it to secure its bona fide settlement by actual settlers. Then leave the matter to the good sense and to the necessities of the people, and let them settle it as fast or as slow as they choose, in a legitimate way. There is no necessity for the Government to sell the lands any faster than they are pre-empted. To do so, is wrong in principle, and worse in practice.

DECISIONS BY SECRETARY OF INTERIOR—CASE OF FRANCOIS LACOMBE.

January 13- —Certificates of location issued by Surveyor-General in confirmed private land claims under act of Congress of June 2, 1858, *are assignable.*

FROM REPORT OF LAND OFFICE, 1876, p. 50.

"Another very important question has been for some years before the courts and the Department, respecting lands within fraudulent and rejected exterior limits of Mexican and other private grants in California. This question relates to the condition of the lands thus embraced during the period of alleged reservation and prior to the date of determination of the Department or courts of the true limits and area of the private grants. It was finally settled by the Supreme Court in Newhall vs. Sanger, (October term, 1875,) wherein it was declared that these lands were '*reserved*' and not '*public lands*,' and that in consequence thereof did not pass to the railroad companies under their grants made during such reservation, reversing the decree of the circuit court of the United States for the district of California, and *decisively avoiding the Departmental decision of Mr. Secretary Delano in the case of the Western Pacific Railroad Company vs. H. E. Dillingham, et al.*" Applications for patents for homesteads and pre-emptions within exterior limits of invalid Mexican grants are therefore *cut loose,* and the applicants should have their patents.

SUPREME COURT OF THE UNITED STATES,

October term, 1876; Antonia Beryessa, administrator of Nicholas Berryessa, deceased, appellant, vs. the United States; appeal from District Court of the United States for the district of Cal.; Waite, C. J.: The Supreme Court has decided adversely upon claims under Mexican grants where a grant from the Mexican government has not been "deposited and recorded in the proper public office among the public archives of the Republic." Cites: U. S. vs. Camburton, 20 How., 64; U. S. vs. Castro, 24 How., 349; U. S. vs. Knight, 1 Black, 25; Peralta vs. U. S., 3 Wall., 440. Decree of district court affirmed.

The farmers have lately gained the suit against the miners for overrunning their land with debris, and ruining them for agricultural purposes. Probably the matter will be taken before a higher court, but the agriculturists must eventually be protected.

AN EPISTLE BY OUR DREAMY CANVASSER.

In answer to my timid request to subscribe, a California granger as tall as the encalyptus, and with a beard like a redwood top, advanced a stride in my direction, rested one toot on the summit of his gatepost, placed the palm of his hand carelessly on the top of a telegraph pole, took a bird's-eye view of your correspondent's outfit, ejected a narcotic flood from his mouth, submerging some colonies of ants and a beetle ranch, and exclaimed, with a startling abruptness, "What's that, young man?" I dare say I felt like Gulliver at Brobdignag, and for purposes of easy conversation I would fain have sat upon the giant's hat brim. However, I managed to titilate his tympanum at a safe distance.

"Your agricultural papers be blanked!" said he, alarmingly emphatic in word and gesture; "It makes me mad to see what blamed fools them fellers be who write agricultural papers and books, anyhow. Now," said he, twanging the telegraph wire with his little finger, "what d'ye they know 'bout time for plowin', or puttin' in crops, or prunin' vines, out here." I interrupted him with a feeble remark, and intimated that very likely he had been reading an arctic rural, adapted to a soil and climate, remote from the land of the perennial strawberry and pea vine, and that suggestions for cultivating and transplanting the lichen, subsoiling on ice floes, and improving the breed of polar bears and walruses, cannot be safely followed by the California farmer, the conditions in the two sections not being exactly identical. He gave me a contemptuous look and continued volubly, citing numerous instances going to show the worse than Egyptian darkness pervading the minds of agricultural writers and editors in general, and Mr. Greeley in particular. Again I remonstrated, arguing that "What I Know About Farming," though an invaluable agricultural treatise, doubtless, yet is not universally regarded by our farmers as the most reliable authority on California husbandry; that husbandmen who experiment by eastern and foreign journals and have an abiding Mr. Billings almanac as a weather guide for our coast, will occasionally miscalculate; that California publications, especially the California Agriculturist, are more reliable and much safer guides for our farmers in agriculture and horticulture than the aforesaid authorities; that some chaff is invariably mixed with the wheat in spite of the most careful winnowing by the editor; that even editors have been sometimes deemed fallible by rash and irreverent readers; that no person should imagine his little acre and affairs the object of our special and exclusive solicitude, and that whoever deems knowledge useless which does not refer directly to the crops and flocks within his own gates, is no wiser than an oyster in his unopened shell; that I should advise him to take the——. Here the telegraph wire snapped with a vicious twang, the ponderous foot of Brobdignag came down with a dreadful thud, another narcotic rolled from his mouth and roared past me. At this crisis, fortunately, I awoke in the comfortable bed of a hospitable farmer, to realize that my frequent wrestle with the cynical and skeptical granger had been renewed in my dreams. C.

STOCKTON LETTER.

IRRIGATION—GRAPE CUTTINGS.

Ed. Agriculturist: Many farmers living on the Calaveras and Mormon Channels, which are the two principal outlets of the Calaveras river, are engaged in *damming,* in anticipation that Spring rains will come; in which case four to five thousand acres of land will be flooded by means of these dams. At present water enough to irrigate twenty acres a day is utilized. The flow is decreasing because there is no snow to feed the stream. I have 6000 Muscat of Alexandria vines. I grafted in 500 of that variety last year by the underground process, using two cuttings; nine-tenths of them lived. In case both grafts grow I dig down and saw off one of them.

I propose now to graft 1,500 with Muscats and White Corinth. The latter variety are seedless and very difficult to procure here. Of the Mucat of Alexandria I could sell twice as many as I did last year, which was 13,000. Orders received before March, with cash, will be filled at the rate of $5.00 per M., and shipped in order. I want to buy some Gordo Blanco and Sultana for trial. I believe at Stockton we have one of the best places in the world for grape culture and raisin making.

D. A. Learned.

Jan. 15, '77.

Estimate of Seeds for an Acre.

	POUNDS.
Beets and Mangold Wurtzel	4 to 6
Cabbage	1 to 1½
Carrot	2 to 3
Cucumber, in hills	1 to 2
Clover, red, broadcast alone	15 to 20
Clover, mixed with ½ bushel Timothy and 1 bushel Red Top	10
Clover, white, broadcast alone	10 to 15
Alfalfa	16
Lucerne	15
Onion, in drills	4 to 5
Parsnip, in drills	4 to 6
Radish, in drill	5 to 8
Radish, broadcast	12 to 16
Salsify, in drills	6 to 8
Spinach	8 to 10
Turnip and Ruta Baga, broadcast	½ to 1½
Turnip and Ruta Baga, in drills	1
	QUARTS.
Beans, pole, in hills 3x4	8 to 12
Corn, in hills	8 to 12
Broom Corn, in hills	10 to 12
Mustard, broadcast	12
Sorghum, or Chinese Sugar Cane	2 to 3
	BUSHELS.
Beans, bush., in drills 2½ feet apart	1½
Corn for fodder	3 to 4
Barley, broadcast	2 to 3
Barley, in drills	1½ to 2
Buckwheat	1 to 1½
Hungarian Grass	½
Kentucky Blue Grass	2 to 3
Lawn Grass	2 to 3
Millet, broadcast	½ to ¾
Oats	2 to 3
Orchard Grass	2 to 3
Peas, in drills	2 to 3
Potatoes, in drills or hills, cut tubers	10
Potatoes, cut to single eyes	6
Rye, broadcast	1 to 2
Red Top	2 to 3
Rye Grass	2
Salsfoin	2 to 3
Timothy	½
Vetches	2 to 3
Wheat, broadcast	1 to 2
Wheat, in drills	½ to 1

The Poultry Yard.

PRACTICAL POULTRY KEEPING

We find the following very practical article in the *Russian River Flag*. It is just such information as our readers will appreciate.

Ed. Flag:—At your request I give some of my experience with poultry, together with hints and items which may be of interest and possible benefit to a portion of your readers, as now-a-days nearly every family that has the room keeps more or less fowls, if only to supply their table with undoubtedly fresh eggs and occasionally a broiled or a roast chicken.

LEGHORN FOWLS.

It is now well established that pure Leghorn fowls far exceed any other variety in laying qualities. They are hardy, easy to raise, mature early, and when well cared for will lay at six months of age. I have frequently had March-hatched Leghorn pullets commence laying in August, and continue more or less regularly all through the following Winter. I have, first and last, bred twenty different varieties of fowls, and my experience proves the White Leghorn, in comparison to others, to mature earlier, lay earlier, produce more eggs, consume less food, and are the most beautiful and profitable of all fowls. They lay a large white egg, and are docile and easily restrained—seldom or never want to set.

TO INCREASE EGG PRODUCTION,

And keep hens of any breed in good laying condition, they require careful and constant attention. My manner of feeding to ensure the greatest amount of eggs is about as follows: At daybreak in winter, and five o'clock in summer, I give warm scalded ground food, either bran, shorts, cracked corn, ground wheat, or barley, and grain at night, a change occasionally being necessary. In this food once in ten days I mix a teaspoonful of sulphur to a dozen fowls—and two or three times a week the same proportion of cayenne pepper. Meat is supplied twice a week, and if there is no grass that the fowls can get I feed turnip tops, cabbage, or onions, cut up, every day; give them pounded oyster shells, and ground bone or bone meal, which is prepared especially for poultry. I experienced some trouble at first in getting the latter article on this coast, but now receive it from the mills in large quantities. It costs five or six cents a pound, and is not only the most convenient to use, but is the best article known to stimulate hens to lay and encourage growth in chicks. One spoonful a day to a dozen or fifteen hens, mixed in their morning feed, or one-third the amount to the same number of growing chicks. I consider this the most profitable feed I give.

Hens will lay and lay well at certain seasons of the year without the above extra care. But with it good laying breeds will lay the year around with the exception of a few days' rest, say five to nine, at the end of each litter of 20 to 30 eggs. I have had Leghorn hens produce 250 eggs in a year, with extra care, while common stock with common care will not lay more than 75 to 100. I never keep hens for laying to more than 18 or 20 months of age, or to their second moult, but good stock birds three to five years; these, however, I never feed pepper or other stimulating food.

TO PREVENT VERMIN

If sulpher is fed as before directed and coal oil occasionally applied to the perches, houses kept white washed outside and in, vermin will not trouble the fowls. When a hen is placed to set, sprinkle a spoonful of sulphur or carbolic powder in the nest, and again at the end of ten days, and also dust some under the wings and feathers. With this treatment my hens never suffer from insects.

SEASON TO RAISE CHICKS.

Young chicks cannot be raised to any advantage in the dryer parts of California, from June to October, but at all other seasons they do well if properly cared for. My mode of caring for them is as follows, and I lose very few: My breeding fowls, to commence with, are healthy and vigorous from having fresh blood introduced as often as necessary.

THE CHICKS WHEN HATCHED

Are left undisturbed for twenty-four hours, then removed to a comfortable coop with the hen mother, and fed a hard-boiled egg, chopped fine, with about the same weight of white bread; after the second day, white bread and baked corn-cake crumbled fine. After the first week corn-cake alone, and after the second week, scalded meal and bran or shorts, and the last thing at night, cracked corn with the fine part sifted out, or a few grains of wheat. Pure fresh water is kept before them all the time.

With this manner of feeding my young chicks never have the diarrhea (*i. e.*, excrement adhering to the fluff), but when fed at first with wet or soft food, this is apt to be the case; they get dumpy, wings droop and finally die. Milk, either sour or sweet, is most excellent for chicks, as well as grown fowls. When insects are scarce I give them meat two or three times a week; this is not a necessity, but it makes them grow faster and larger.

GREEN FOOD

Must be had in order to have them do well, so I endeavor to raise them during the grass season, which supplies all they need. There are other items in regard to the setting of hens; diseases peculiar to this coast, and their treatment, etc., which I would be glad to give if a sufficient desire is indicated by your many readers, but as this article is already too long, I must omit further reference to them here.

POULTRY PAYS.

There is no question in my mind but poultry can be made to pay better than any other live stock on the Pacific coast, in proportion to the capital invested. Prices of eggs and poultry are always high compared with the Eastern market; the demand is unlimited and will always exceed the supply, as may be seen by the European markets, where prices are constantly increasing. Eggs in London and Paris are at least fifty per cent higher than twenty years ago. In order to pay, fowls must have constant attention, and can never be allowed to suffer from a day's neglect, which may take several days' close care to recover; new blood should be mingled yearly, to ensure health, size and stamina; if kept for eggs the progeny of common hens crossed with Leghorn cocks, will increase the quality of eggs at least fifty per cent; and this without any extra expense of keeping. Common fowls crossed with light Brahmas make a splendid market or table bird, the size being increased nearly one-half; of course they consume more than a smaller breed, but they always bring the largest price.

C. P. Stone.

Healdsburg, Dec. 19, 1876.

The editor of the *Flag* adds the following:

Mr. Stone's hen-houses are located in different parts of a 7-acre lot, 50 fowls being the maximum allowed to each house. The setting houses are furnished with portable boxes containing two nests each; this arrangement prevents the hens from quarreling over their nests, and at the same time enables each one to find her own without difficulty. These setting boxes are thoroughly ventilated, but protected from the weather. After hatching, the hens and chickens are removed to roomy coops with wooden floors, covered with several inches of dry earth. These are located and conveniently arranged in a one-acre lot, where they are free from any annoyance from other fowls, until they are able to take care of themselves, when they are removed to the larger lot. Near the time for hatching the Brahma eggs are moistened daily in warm water for the purpose of softening the shell and membrane inside, so that the chicks can easily force their way through. The feed used is ground barley, wheat, cracked corn and chopped vegetables. Crackings as a substitute for meat are procured from the lard factories in San Francisco.

Mr. Stone has had fifteen years' experience in the business in different localities, both in the Atlantic States and on this coast. He considers the White Leghorn the most profitable variety for producing eggs, while the Brahma is preferred for the table, being of much quicker growth, and attaining a much larger size; he finds no difficulty in disposing of all the eggs at $2 per dozen, and the fowls at $2 each. Mr. Stone paid for Brahmas at the rate of $17 per trio, and for Leghorns at the rate of $15 per trio.

Raising Fowls.

The following article, which we clip from the Tenn. *Rural Sun*, is exactly suited to California, and is just as good as though we wrote it. Now is the time to begin to think about some business that will pay, when crops—not the chickens', but the grain crops—may be short:

"It may be safely asserted that the people of America, with all their advantages of climate and variety of soil, have never learned to raise one fowl where France produces one hundred. There are more fowls consumed in that country than any other in the world according to population. There, raising poultry is a regular business, and they make it pay. The two great staples in that country may be said to be *fowl* and *grape*, and that they live by and upon these two. We possess facilities for the production of both of these in richest abundance, and the inquiry is simply our people are not willing to raise fowls, because two many of them feel and think it too small a business to be engaged in. Each family raises some; very few families raise enough for their own family use; and it is a very rare thing to find one where enough is raised to make it profitable as a business. In order to conduct poultry raising profitably it is important to have the best varieties for this section, with arrangements for keeping in separate yards, scattered about the farm, so as not to engender disease by too many in a flock, and all their quarters kept in order, and plenty of good, pure water, with choice suitable food. In raising fowls very great care must be had not to crowd too many together, cleansing and fumigating the establishment.

The whole economy of this industry has to be studied and practiced to be made profitable, and it will then be found to be one of the best for the amount of investment and labor. The profit is first in having the very best food in eggs and meat that can be for the family use; and next in raising what is always ready sale at good prices the year round, bringing in a continuous stream of money. The little boys and girls can be well and profitably employed in this work, and it all tells in summing up the family work and earnings. Let our people have more fowls and fewer foul chicken houses.

It is a well known fact that a hawk will always light on some conspicuous place close to the poultry yard, from which to swoop down on his victims. Taking advantage of this, erect a pole with a flat surface at the top just large enough to hold a strong steel trap. Fasten the trap with a chain to a staple in the pole and await results. No bait will be needed, for the hawk will be quite certain to light on the trap and be caught. A gentleman who has tried this method has succeeded in killing all the hawks in his neighborhood, and now can raise poultry without loss, except by accident.

Eggs for Hatching.—An English agricultural paper says that eggs intended for setting should be stored with the large end down, because the air bubble does not spread so much as when the small end is down—this spreading of the air bubble being known to affect the freshness and vitality of the egg.

A comparison of the weight and cost of a passenger train on the eastern, standard gauge, and on the Boston, Revere Beach, and Lynn Railroad, narrow gauge respectively, has been made. These two roads run nearly side by side and the carrying capacity of the two trains is practically the same. The heavy Pullman car is a disadvantage to the Eastern Road, gives capacity for 230 passengers, weigh 138 tons, and cost $63,000; one locomotive and six passenger cars on the Revere Beach and Lynn Road give capacity for 272 passengers, weigh 53 tons, and cost $18,000.

Grapes for Hogs.—It will take more pounds of grapes to make a pound of pork than it will of corn, but grapes will fatten hogs faster than corn, and they are much better than barley or corn to feed young pigs when weaning them from the milk of their mothers. Indeed, they are the best substitute for milk to feed young pigs on we have ever found. Those who have grapes and pigs will sell their grapes much better by turning their pigs into the vineyard than by picking and freighting the grapes to market at the present price.—*Record-Union.*

California is the Spain and Portugal and France of America, and may one day rival those countries in the production of raisins and wine. The samples sent East last year, to Chicago, New York, etc., exceeded expectation, and were viewed very favorably by connoisseurs. In New York a box was placed side by side with a box of imported fruit, and lost nothing by the comparison—was even pronounced fresher, of better flavor and finer bloom, and Shylock himself could not have found fault with the weight.—*Am. Grocer.*

Salaries must be made large enough to support th dignity (?) of our government officials in the style of European princes and nobles, though the people starve.

Agricult'l Progress.

Is Production Declining.

AGRICULTURAL speakers and writers often give the impression, without positive assertion, that we produce less in proportion to population than formerly. If this is so we eat less than formerly, for we export more. But no intelligent person, after due deliberation, will assert that we feed less to farm animals or live less generously ourselves than our fathers fed and fared. A statistical answer in the negative has been made by the Statistician of the Department of Agriculture, in an address delivered before the Agricultural Congress at its last session in Philadelphia, as follows:

There are problems presented daily which only agricultural statistics can solve, and upon which largely depends the future prosperity of the farming interest. We cannot here enumerate them but a reference to one or two may suffice. The inquiry has been often made of late, Is production declining? It has been assumed that we produce in proportion to population less of the great staples of production than formerly. It is the province of agricultural statistics to decide the question. The census alone cannot determine it. Such is the fluctuation in rate of yield, that the supply of a given staple may be actually increasing, while the product of the census-year may be less than its predecessor ten years before. For instance, corn for 1869 was returned 760,944,549 bushels, and in 1859 the figures were 838,792,742. It has often been asserted on the strength of these returns, that corn production was declining, not only per capita, but in absolute comparison of quantity. Is it so? The year 1869 witnessed what in country parlance is called "a failure" of the corn crop. It is plainly folly to take such a crop for comparison. And this fact illustrates the absolute necessity of annual estimates to supplement decennial returns. Since 1869 there have been six harvests exclusive of the present one. Of these six, the largest and smallest stand in juxtaposition: the one in 1875, the largest ever made, is 1,331,000,000 bushels; and the other, another failure, in 1874, 850,000,000 bushels. The increase in a single year is 56 per cent. In 1870 and 1872 the product was nearly 1,100,000,000; the average of annual estimates, for the six years since the census, 1,047,000,000 bushels; and this confirms the opinion, founded on careful study of the history of cropping in 1869, that it was scarcely more than three-fourths of a full crop. Now, let us examine a period of twenty-six years. We find that the yield per capita in 1849 was 25.5 bushels; in 1859, 26.6 bushels; and in 1869, the year of a three-fourths crop, 19.7 bushels—the same result as that deduced from the period since that census. If we take the year 1875, the result is excessive, 30 bushels per capita, but include it in the period of six years past, and we have 25.5—precisely the supply of 1849.

As to wheat, a general deduction from comparison of census exhibits is less erroneous. The increase in round numbers was from 100,000,000 to 173,000,000, and again in 1869 to 287,000,000. Now, the latter was a large crop, yet the average for the six subsequent crops is 266,000,000, while the estimate for the last year of the six was 292,000,000. Distributed according to population, there were 4.3 bushels per head in 1849, 5.5 in 1859, 7.46 in 1869, and for the period since 6.6 bushels. This shows an increase of more than 50 per cent. in the proportion of supply in twenty-six years, and is exactly in accordance with the history of the several crop years, and is a proof of the substantial correctness of these estimates.

The export figures illustrate further the fact of the large increase of wheat-production. The total export of wheat and flour in fifty years is equivalent to 1,062,000,000 bushels of wheat, while 91,000,000 were shipped during a single year, 1874. The exports of one-half of this period up to 1850 were only 178,000,000—less than twice those of 1874. The heavy increase during recent years is especially noteworthy, nearly half of this semi-centennial aggregate having been shipped in ten years. While our population has nearly doubled since 1849, the quantity of all cereals taken together has more than doubled. The census reported 867,000,000 bushels. Allowing something for incompleteness of that enumeration, 2,000,000,000 bushels produced in 1875 allow a distribution of 46 bushels to each inhabitant, in place of 37.4 census-bushels, or possibly 40, with a complete enumeration. Our average supply since the last census exceeds 40 bushels; and thus is demonstrated the remarkable fact that, with our rapid increase in numbers, perhaps without a parallel, we not only keep up our high standard of cereal production, but actually advance it. This is owing to our vast areas in instant readiness for the plow, to our advance in variety and perfection of agricultural machinery, and to the stimulus of a foreign demand, which has never been so pressing as during the last ten years. It is possible to double our present population without diminishing this high rate of supply. There is more danger at present of overproduction and unremunerative prices than of scarcity. The proportion engaged in agriculture in the West is still too large, and far too large in the South; and the withdrawal of workers from rural to other industrial arts would not only greatly facilitate the creation of wealth, but would stimulate invention, labor-saving skill, and industry in agriculture.

Having reached the conclusion that corn-production is not declining, and that the supply of wheat has increased 50 per cent, what can we say as to the meat-supply and the number of horses? As to the latter, it is not found, according to the fears of too conservative farmers a former generation, that multiplying railroads tends to diminish the use of horses. More horses are now used in taking people to the train than were formerly required to perform the whole journey. The census reports only the horses of the farm, without reference to those of the town or city; but, for comparison, taking the numbers in proportion to population, there were nearly 20 to each one hundred people in 1850, quite twenty in 1860, and, notwithstanding the waste of the war, eighteen in 1870. The increase since has at least equaled the advance in population. Coming to cattle, while we know that the numbers in the census are too low, especially for Texas, California, and the Territories, we may use them for comparative purposes. From 1850 to 1860 we find the number of all kinds of cattle slightly increasing, from 77 to 81 to each hundred of the population, and then witness a decline to 62 in 1870. Since that date the numbers have increased, but not materially faster than the population. The consumption in the war was a prominent cause of the decline, and a growing preference to horses as a substitute for working oxen tended to further reduction. The supply of sheep per capita was somewhat greater in 1870 than in 1860, the ratio rising from 70 to to 73, but less than in 1850, when there were 93 per hundred of population. But the most marked decline in supply has been in swine; the figures in these decennial periods being respectively 129, 105, and 65. The tendency is to still further decline in some of the principal swine districts.

There is another statistical point of especial interest in this connection. While numbers have declined in proportion to population, the value of all farm animals divided among the population would give about $24 per head in 1850, $34 in 1860, and $44 in 1870. Not only has scarcity increased the value, but improvement in breeds has added size and weight, so that with smaller relative numbers we are able to feed our people and ship more beef and pork and lard than over. Here is food for reflection. Here is the cause of advancing prices of beef and pork. And it is fortunate that increase in meat production is consonant with a higher and more intensive agriculture; that it is, in fact, one of the essential conditions of such improvement. If we act upon the suggestion of Mr. Harris, and perfect breeds of meat producers that shall be able to assimilate a larger proportion of the fat and meat producing elements contained in the food supplied, we shall hasten the adoption of a system of agriculture that shall be restorative and not exhaustive.

We thus learn from statistics that grain-growing exclusively, though remunerative as a temporary expedient, is a speculation and not true farming. Land in the prairies worth $50 per acre is bought for $5, and its true value is discounted in installments; i. e., the soil is plundered piecemeal, and converted into wheat and cash to furnish means for fencing and house-building, and to supply capital to the pioneer farmer. In this point of view, it has been remunerative as a pioneer expedient; but with a farm equipped for the work of a long future, the superior profit of a restorative system, in which domestic animals fill an important part, cannot be questioned.

Investigations in Seeds---The Seed-Control System in Germany.

Of the many new ways in which science has, during the past few years, been applied to agriculture, one of the most interesting and useful is in the examination of seeds. In 1869, Dr. Nobbe, director at the station at Tharand, in Saxony, commenced the study of the seeds in common use in German agriculture, and founded the first "seed-control station." How much good has come from this may be inferred from the fact that during the seven years that have since intervened, over 4,000 samples of seeds have been examined at Tharand; that an astonishing amount of adulteration has been discovered, so much so as to exert a by no means inconsiderable effect upon the agriculture of the country; and that the importance of the work has come to be recognized so fully as to induce the establishment of a number of seed-control stations in Germany and other European countries. Various kinds of adulterations have been discovered. Sometimes these consist merely in seeds of weeds and other extraneous plants, either of inferior value or positively harmful, which have been gathered with the genuine seeds; sometimes they consist of inferior seeds purposely added to increase the bulk and weight of the wares sold. In some cases the seeds used for adulteration are deprived of vitality by previous steaming, roasting or boiling; in others, so base are the practices to which the love of unlawful gain will stoop, not even this means is used to prevent the injury which must be brought upon the consumer by raising useless or noxious plants, instead of the useful ones he seeks. Genuine seeds which have lost their vitality by age are often mixed with fresh seeds. The most barefaced, though not the most harmful seed-swindling discovered by Professor Nobbe, consists in grinding quartz rock, sifting out particles of the proper size, dyeing them in proper colors, and mixing them with clover seeds. Samples of clover seed containing 25 per cent by weight of this admixture of colored grains of quartz can be distinguished only by very close and careful examination from the unadulterated seed.

So patient, ingenious, and successful have been Dr. Nobbe's investigations, that he is able to distinguish with accuracy the seeds of the common cultivated plants and weeds, and to determine as well the percentages of pure seeds and adultenations, as what proportion of the genuine seeds are capable of germinating and thus producing vigorous plants.

One outgrowth of Dr. Nobbe's work at Tharand, is his lately completed *Handbuch der Samenkunde*, volume of 642 pages, of which 366 pages are devoted to the physiology of seeds, 138 to the means of determining their agricultural value, and the rest to the means of preventing frauds, and other topics.

Dr. Nobbe points with pride to the fact that at the time of the completion of this work there were already established in Germany some twenty seed-control stations, whose directors had almost without exception spent more or less time at the station at Tharand in preparing for their work, that still more stations were to be established in Germany, and that similar institutions were founded or proposed in Denmark, Austria, Hungary, Holland, Belgium, and Italy. A similar arrangement should be established in the United States.

Words of Praise.—The New York *Evening Mail* has an article on raisin curing in California, endorsing the general belief that it is destined to become a great industry, which it concludes with the annexed paragraph:

With her mines of precious metals still adding their stores to the wealth of the world; with her wheat successfully rivalling that of any other clime; with her cigars and tobacco equal to the best that Havana sends us; with her magnificent fruits, extorting the admiration of all who see them or taste them; and now, with her new raisin-producing industry, surely our sister of the Pacific slope has almost an embarrassment of riches, and, perhaps, more than her fair share.

Grapes at ten dollars a ton pay big in old, established vineyards. Mr. I. De Turk, of Sonoma county, has thirty acres of vines, young and old, which averaged six and one-half tons to the acre, or two hundred tons to the whole vineyard, this year, making about 60,000 gallons of wine, equal, if not superior, to the vintage of any previous year since he has been in the business. Even at the extreme low price of grapes—$10 per ton—it will be readily seen that a well cultivated vineyard is profitable—more so than staple crops. Sixty-five dollars an acre leaves a net profit of $55 per acre. At any figure above $10 a ton, grape culture is enormously profitable.—*Foot-Hill Tidings.*

The Kitchen.

Work, Work, Work.

Work, work, work,
Is ever the farmer's song,
There's never a time to stop and think,
Be the evenings ever so long.

Yes, work, work, work,
Till your hands are hard and rough;
Work, and wring, and scrape,
Till your finger nails wear off.

And then sit down and write
Of the joys of a farmer's life;
'Tis Oh, to be a slave,
Or a modern farmer's wife.

Oh no, the men are not to blame,
For they do all they can;
But then there are a hundred things
That are beyond a man.

They do their work, then go to sleep,
No "yeast" in on their minds;
If all the babies wake and weep,
It ne'er disturbs a man.

It's work, work, work,
Yes, cook, and weed, and hoe,
Till our lady-like and dimpled hands
Are NOT "as white as snow."

I would that I were dead,
And buried in a "row;"
Under a fragrant cabbage head,
And at my feet a "hoe."

A "mushroom" planted at my head,
So that its VERDANT shade
Might woo the birds to come and sing
About my lonely grave.

But I can't die, I have no time,
I would take a day or two,
And stop the plow, so I must wait
'Till the busy time is through.

—[Prairie Farmer.

Bread--Stale and Fresh.

I DON'T like stale bread—do you? My reason for disliking it is very much the reason why I don't like Dr. Pell; your reason is really the same, but you probably cheat yourself into the belief that it is something else—namely: because the bread is "so dry." Allow me to undeceive you. *No* bread is dry; bread just baked is nearly *half water;* and the stalest of stale loaves has not more than a hundredth part of this water.

The fact that bread contains nearly half its weight of water, is surprising, but not so surprising as that your own body contains a considerably larger proportion—nearly three-fourths. The flour from which bread is made is dry enough, containing not more than sixteen per cent of water; but it has a great tendency to absorb water, and in the process of baking it absorbs it rapidly. The gum which is produced from the starch of the flour in baking, holds this water firmly, and the gluten which forms a coating round every little hollow in the bread, resists evaporation, and thus bread becomes moist, and keeps moist, let it be ever so stale.

But if stale bread be not dry bread, what is it? What makes that familiar difference between the soft, spongy crumb of yesterday's baking, and the harsh, crumbling morsel of six days old? There is no difference of moisture; every cook or baker will tell us there is no use of placing bread in a moist cellar to keep it fresh or prevent evaporation of its water, since it will assuredly become stale as the hours roll on.

On the other hand, every baker and every cook will also tell us, that if a stale loaf be placed in the oven again for a few minutes, it will come out having, for a time at least, all the characters of fresh bread.

Who does not know the effect of toasting a slice of stale bread? The fire scorches the outside layers and renders them completely dry; but, if the slice be not too thin, we find the interior layers deliciously soft and palatable. It is the water in the bread which prevents the loaf becoming all crust. In an oven with a temperature of 500 degrees, the loaf gets baked or browned outside, and the crust is formed; but the inside never has a temperature above one hundred degrees.

If the inside is thus slow to heat, it is also slow to cool. Every one knows how long the crumb of a roll continues warm, and the loaf taken from the oven at one, even on a cold winter morning, comes warm to the breakfast table at seven.

Does it not seem that the difference between fresh bread and stale bread is only the difference between *hot* bread and *cold* bread; especially when we reflect that we have only to warm the stale bread to make it fresh again. But there is this fact that stands in the way of such an explanation; the bread which has been rebaked, although hardly distinguishable from bread which has been recently baked, is only so for a very short time—it rapidly becomes stale again. Were this not the case we need never have to complain of stale bread.

The conclusion drawn from experiments is, that staleness depends on a peculiar condition of the bread, and this condition is itself dependent on a fall of temperature. —*Dr. Lockridge.*

Usefuyl Hints.

In copper utensils, if the tin has worn off, have it immediately replaced.

Be clean in your person, paying particular attention to the hands, which should always be clean.

Empty soups or gravies into a basin as they are done; never allow them to remain all night in the stock pot.

Cleanliness is the most essential ingredient in the art of cooking; a dirty kitchen being a disgrace to both mistress and maid.

Be very particular in cleaning all vegetables free from grit. Nothing is so unpleasant, and nothing so easily avoided, if but common care be exercised.

Do not go about slipshod. Provide yourself with good, well-fitting boots. You will find them less fatiguing in a warm kitchen, than loose, untidy slippers.

If you have a spare kitchen cupboard, keep your baked pastry in it; it preserves it crisp, and prevents it from getting wet and heavy, which it is liable to do in the larker.

If you have a large dinner to prepare, much may be got ready the day before, and many dishes are a great deal better for being thus made early. To soups and gravies this remark is particularly applicable.

Provide yourself with a dozen good-sized serviceable cooking aprons, made with bibs. These will save your gowns, and keep you neat and clean. Have them made large enough around so as to nearly meet behind.

Clean your tins with soap and whitening rubbed on with a flannel; wipe them with a clean, dry, soft cloth, and polish with a dry leather and powder whitening. Mind that neither the cloth nor the leather is greasy.

Never let your stock of spices, salt, seasonings, etc., dwindle down so low that some day, in the midst of preparing a large dinner, you will find yourself minus a very important ingredient, thereby causing much confusion and annoyance.

Do not scrub the inside of your frying pan, as after this operation any preparation fried is liable to catch or burn in the pan. If the pan has become black inside, rub it with a hard crust of bread, and wash in hot water mixed with a little soda.

Pudding cloths and jelly bags should have your immediate attention after being used; the former should be well washed, scalded, and hung up to dry. Let them be perfectly aired before folded up and put in the drawer, or they will have a disagreeable smell when next wanted.

Do not be afraid of hot water in washing up dishes or dirty cooking utensils. As they are essentially greasy, lukewarm water cannot possibly have the effect of cleaning them effectually. Do not be chary also of changing and renewing the water occasionally. You will thus save yourself much time and labor in the long run.

When you have done peeling onions, wash the knife at once, and put it away to be cleaned, and do not use it for anything else until it has been cleaned. Nothing is nastier or more indicative of a slovenly or untidy cook than to use an oniony knife in the preparation of any dish where the flavor of the onion is a disagreeable surprise.

After you have washed your saucepans, fish kettles, etc., stand them before the fire for a few minutes, to get thoroughly dry inside, before putting them away. They should then be kept in a dry place, in order that they may escape the deteriorating influence of rust, and thereby be quickly destroyed.

"Domestic Economy."—Miss Sedgwick has asserted that "the more intelligent a woman becomes, other things being equal, the more judiciously she will manage her domestic concerns." And we add that the more knowledge a woman possesses of the great principles of morals, philosophy, and human happiness, the more importance she will attach to her station and to the name of a good housekeeper. It is only those who have been superficially educated, or instructed only in showy accomplishments, who despise the ordinary duties of life as beneath their notice. Such persons have not sufficient clearness of reason to see that "Domestic Economy" includes everything which is calculated to make people love home and be happy there.

ORIGINAL RECIPES BY COELIA.

Apple Blancmange.—Pare and core enough sour and juicy apples to fill an ordinary pudding dish three-quarters full; sugar and cinnamon to suit the taste; add one pinch of salt; take four heaping spoonfuls of corn starch, wet it with cold water, and then mix it rapidly with one quart of boiling water; add three quarters of a cup of sugar, and boil five minutes. Pour this over the apples, beating the mixture well, then bake in a slow oven six hours. It is best eaten cold.

Excellent Veal Loaf.—Three pounds veal cutlets and a small piece of salt pork (uncooked) chopped together very fine; one teacup of cracker crumbs moistened with a little water; one egg; season with salt and pepper; add sage or savory if you like. Bake one and a half hours and slice when cold.

Household Advice.

The Use and Care of Lamps.

ALL explosions of petroleum lamps are caused by the vapor or gas that collects in the space above the oil. When full of oil, of course the lamp contains no gas, but immediately on lighting the lamp consumption of the oil begins, soon leaving a space for gas, which commences to form as the lamp warms up, and after burning a short time, sufficient gas will accumulate to form an explosion. The gas in a lamp will explode only when ignited. In this respect it is like gunpowder. Cheap or inferior oil is always most dangerous.

The flame is communicated to the gas in the following manner: The wick tube in all lamp burners is made larger than the wick which is to pass through it. It would not do to have the wick work tightly in the burner; on the contrary, it is essential that it move up and down with perfect ease. In this way it is unavoidable that space in the tube is left along the sides of the wick sufficient for the flame from the burner to pass down into the lamp and explode the gas.

Many things occur to cause the flame to go down the wick and explode the lamp: First, a lamp may be standing on a table or mantel, and a slight puff of air from an open window or door may cause an explosion; second, a lamp may be taken up quickly from a table or mantel and instantly exploded; third, a lamp is taken into an entry where there is a drught, or out of doors and an explosion ensues; fourth, a lighted lamp is taken up a flight of stairs, or is raised quickly to place it on the mantel, resulting in an explosion. In these cases the mischief is done by the air movement—either by suddenly checking the draught, or forcing air down the chimney against the flame; fifth, blowing down the chimney to extinguish the light is a frequent cause of explosion; sixth, lamp explosions have been caused by using a chimney broken off at the top, or one that has a piece broken out, whereby the draught is variable and the flame unsteady; seventh, sometimes a thoughtless person puts a small size wick in a large burner, thus leaving considerable space along the edges of the wick. An old burner, with its air draughts clogged up, which rightfully should be thrown away, is sometimes continued in use, and the final result is an explosion.

The following directions for using kerosene lamps are issued by a famous lamp manufacturer, and seem worth publishing for general information:

1. Dry the wick before the fire.
2. Use none but the best oil.
3. Fill the container with oil each time before lighting. Cut the wick the same curve as top of cone.
4. When the wick is well saturated with oil, light with wax taper, turn it below the cone until the flame appears only about half an inch above the cone, put on the chimney, and then turn the pinion slowly until the flame is the required height.
5. The wick must be always below the cone when burning.
6. The flame must never be allowed to remain less than three-quarters of an inch above the cone, or the lamp will smell.
7. Cleanliness is imperative to the well burning of the lamp. Keep all perforations perfectly free from wick cuttings, paper ash, etc.; all burners take to pieces to gain access to interior.
8. To extinguish the light turn it down

until a small blue flame appears; it will then begin to flicker, and eventually go out.

Sometimes the wick becomes too short to carry up the kerosene, and the lamp goes out. If you have not time to put in new wick, a piece of cotton rag pinned on below will answer every purpose, and become a good feeder. If a hole should become broken in the glass chimney, paste on a piece of paper, which may often be done in a moment, and it will answer its purpose well for a long time, or until you get a new chimney. Sometimes the burners of lamps become gummy, and prevent the wicks moving freely. Boil them up in suds over the fire a short time, and they will become entirely clean and work well.

To Extinguish Kerosene Flames.—One of the most ready means is to throw a cloth of some kind over the flames, and thus stifle them; but as the cloth is not always convenient to the kitchen, where such accidents are most likely to occur, some one recommends flour as a substitute, which, it is said, promptly extinguishes the flames. It rapidly absorbs the fluid, deadens the flame, and can be readily gathered up and thrown out of doors when the fire is out.

Prevention of Fire.—Keep matches in metal boxes, and out of the reach of children; wax matches are particularly dangerous, and should be kept out of the way of rats and mice. Be careful in making fires with shavings and other light kindlings. Do not deposit ashes in a wooden vessel, and be sure that burning cinders are extinguished before they are deposited. Never put firewood upon the stove to dry, and never put ashes or a light under a staircase. Fill fluid or spirit (or kerosene) lamps only by daylight, and never near a fire or light. Do not leave a candle burning on a bureau or a chest. Always be cautious about extinguishing matches or other lighters before throwing them away. Never throw a cigar stump upon the floor, or into a spit-box containing sawdust or trash, without being certain that it contains no fire. After blowing out a candle, never put it away until sure that the snuff is out.

Farmers' Shoe Grease.

Put into some fire-proof vessel one-fourth pound of lard or soft grease, like lard, one-fourth pound of tallow—beef or mutton tallow—one-fourth pound of bees-wax, half a pound of neat's-foot oil, three or four tablespoonfuls of lampblack and a piece of gum camphor as large as a hen's egg. Melt the ingredients over a slow fire, and stir them thoroughly after they are melted. Never heat it so hot as to make it boil. Soft grease which has salt in it will not injure the leather. Now have the leather warm, and warm the grease, not so it will flow, but have it so soft that it may be put on with a brush. Should the leather seem to need it, give the shoes or boots an oiling occasionally. It is not best to dry this grease all in before the fire, but allow it to remain on the surface of the leather. A light coat of this kind will exclude the water even if the boots are exposed to the wet all day. This shoe-grease will not injure leather by making it hard and inelastic. When a man's boots are exposed to the wet he should hang them up in the kitchen where the leather will gradually dry, and put on a little grease every morning. It is far better to grease a little often, than to grease bontifully every ten or twelve days. Leather should not be allowed to become very dry before greasing. Always apply the grease as soon as the leather is almost dry, then the leather will be mellow and never become hard. Nothing injures shoes or boots more than to set them aside to dry when covered with dirt. Keep boots and shoes away from the fire when they are liable to become heated. Heating injures the leather.

Another: Take one part (by weight) rosin, one part beeswax, and four parts good, fresh lard. Mix and melt together over the fire, so as to be sure not to burn the mixture. It makes an ointment that is superior to anything I have ever seen tried, for the flesh of either horses or cattle, for either fresh or old sores, and is especially good to remove old, dry scabs.

The mixture is the best thing I ever used for boots or shoes for out-door wear, as it makes the spongy leather waterproof, and the hard leather soft.

Cement for Mending India Rubber.—Cut virgin or native India-rubber with a wet knife, into the thinnest possible slices, and with shears divide these into threads as fine as fine yarn. Put a small quantity of the shreds (say one-tenth or less of the capacity of the bottle) into a wide-mouthed bottle, and fill it three-quarters full of benzine of good quality, perfectly free from oil. The rubber will swell up almost immediately, and in a few days, especially if often shaken, assumes the consistency of honey. If it inclines to remain in undissolved masses more benzine must be added; but if too thin and watery, it needs more rubber. A piece of solid rubber the size of a walnut will make a pint of the cement. This cement dries in a few minutes.

Chapped Hands.—A writer in the *American Grocer* asserts that to preserve the smoothness and softness of the hands, keep a small bottle of glycerine near the place where you habitually wash them, and whenever you have finished washing, and before wiping them, put one or two drops of glycerine on the wet palm and rub the hands thoroughly with it as if it were soap, then dry lightly with a towel. Household work and bad weather will not prevent your skin from being smooth and soft, if this plan of using glycerine is followed.

Damp Closets.—For damp closets and cupboards generating mildew, a trayful of quicklime will be found to absorb the moisture and render the air pure, but of course it is necessary to renew the lime from time to time as it becomes fully slaked. This last remedy will be found useful in safes and strong rooms, the damp air of which acts frequently most injuriously on the valuable deeds and documents which they contain.

To Fasten Loose Window-Sashes.—The convenient way to prevent loose window-sashes from rattling unpleasantly when the wind blows, is to make four one-sided buttons of wood, and screw them to the beading which is nailed to the casings of the window, making each button of proper length to press the side of the sash outward when the end of the button is turned down horizontally.

Soap Bits—To put to use bits of soap which are still too good to throw away, but are a nuisance in the soap dish, place all, even to the smallest pieces, in a small bag of flannel, and they will be found to make the most delicious lather for the bath.

To Fill Cracks in Stoves or Stove-pipes.—Use stove polish wet with turpentine; it should be used when the stove is cold.

Pisciculture.

Experience in Fish Culture.

BY SETH GREEN, IN THE CHICAGO TRIBUNE.

In the fall of the year 1837, while I was trout fishing in Canada, I saw some salmon make their nests in the gravel, and cast their spawn, and cover them up with gravel. I watched them two days, and made up my mind that fish eggs could be hatched artificially and at some future day I would try my hand at it. I watched the habits of different kinds of fish, whenever an opportunity presented itself. In the summer of 1864 I bought a part of Caledonia Creek, which is celebrated as a brook trout stream, and immediately began the construction of ponds, raceways, etc., in preparation for the approaching spawning season. When the time arrived, October 20th, I took my first spawn. At my first attempt I filled a milk-pan half full of water, and stripped the milt and spawn of the male and female in it. I examined them every day, and November 6th I could tell the eggs that were impregnated, and, by carefully counting, found that there was 25 per cent impregnated. I consulted Mr. Stephen Ainsworth, a gentleman who, I knew, had had as much experience in, and was as well read on, the subject as any one up to that time. I told him what I had done, the per centage I had impregnated, etc.; and he told me that was as good a per centage as had ever been impregnated in any country. I made up my mind that if I had to pick out 75 per cent of the eggs I took, I should not propagate many fish. I had a good many difficulties to overcome, and I thought to overcome this by experimenting. I tried first on the belief that one drop of milt was sufficient to impregnate a pan of eggs, which I found was a mistaken idea. I continued taking spawn in the same way till November 7th, when it occurred to me that, by using little or no water, the milt would have a better chance to act on the spawn. I accordingly took some spawn in the above way, and, November 23d, I found that, instead of 25 per cent impregnated, I had 97 per cent. That was the first improvement I had made, and I felt very much gratified, as I had accomplished something which had never been accomplished before, the thirty-second day I had been taking spawn. I practiced this dry impregnation for four years before I told any one. I sold the spawn for from $8 to $10 per 1,000, and it was as safe to me as though I had a patent right on it. During the four years my success had gone the rounds of the papers, and the Fish Commissioners of the New England States, hearing of my success, came to me and made arrangements with me to come to the Connecticut river and undertake the artificial propagation of shad. As Holyoke, Massachusetts, was thought to be the best point to begin operations, I accordingly went there. I arrived there June 29th, 1867, and as this was my first attempt at shad-hatching, my troubles were not few. My first experiment was to hatch the spawn on gravel—the same as I did trout; but as they were so much lighter than trout-spawn, it would not work. I tried numerous other experiments. Among my experiments I had a box with a sieve bottom, and as I was examining the spawn, I accidentally inclined the box so that the current, striking the lower edge of the box, caused a back-action, and the eggs began to boil up. This was just what I had been looking for, and I nailed cleats on the sides to keep it in the inclined position. This was the fifth day after I had arrived at Holkoke, and by this simple contrivance I hatched 15,000,000 in ten days. There had been a number of attempts to hatch shad by different parties years before, but all had failed because the spawn were so light they could not find any hatching apparatus that would hold them and give them circulation enough. This was my next great success, and it is worth millions of dollars to the country. There will be plenty of shad for all future time, and, if it had not been discovered, they were as sure to become extinct as all kinds of game. It will not be many years before all kinds of game will be gone in this country.

In 1867, and for years previous, shad had been selling for $40 per hundred. In the year 1870 shad were very plenty, and have been every year since. They have been sold as low as $3 per hundred during the last four years. I will copy an extract from the Fish Commissioner's report of the State of Massachusetts for the year 1871:

"The season was remarkable for the great take of fish in the river, which was the more striking because of the gradual decrease of the fishery for many years. On Sunday, May 21st, vessels in Long Island Sound observed the unusual spectacle of vast shoals of shad. The next day they struck in at about the mouth of the river, and filled the nets. At Lincoln, ten miles from the mouth, and on the coast, 3,560 fish were taken in one pound, (500 is usually a large catch), and the total yield for the pounds for that day was over 25,000. At Haddum Island, a short distance up the river, 700 were taken at one sweep of the seine, which is more than one-third the yield of a similar seine for the whole of a previous season. A seine four miles below Hartford took 900 shad the same day. As this is some fifty miles up the river, it is plain that the schools struck in all at once, and that those which headed for the stream kept on with great rapidity. Now, it does not appear that in the Hudson to the west, or in the Merrimac to the east, the run of shad was unusual. On the contrary, both rivers report a small average.

"Whence, then, this local phenomenon? The Connecticut people call them "Green's shad," attributing the increase to the artificial hatching of Seth Green at Hadley's Falls in 1867; and this opinion gets color from the fact that in 1868 the small yearling fish were unusually plenty."

Again, I copy from the Fish Commissioner's report of Connecticut for the year 1873:

"The number of shad annually running into the Connecticut river has increased to such an extent that the complaint of the fisherman is no longer of a paucity of fish, but that the market is so overstocked that they do not obtain a remunerative price for them."

Again, the Massachusetts report for the year 1873 says:

"Speaking of the past season, 1872, shad were more plenty and cheaper than ever. The New York market was so completely glutted with them that the dealers refused to receive more than a certain number at any price; the price was reduced from $18 to $3 per hundred."

In the fall of 1867 I hatched whitefish and herring, and in the spring of 1868 I hatched the spawn of the wall-eyed pike and red sides; the fall of the same year I hatched salmon trout, and stocked many waters with them, and have continued every year since I commenced to stock the small lakes with all kinds of bass and wall-eyed pike. I get good reports from nearly all of them. We have 647 lakes and ponds in this State, (New York,) and every one of them is capable of furnishing a fish dinner for every family living within five miles of any one of them. When I commenced experimenting on hatching fish on the Connecticut and Hudson rivers, I was called a lunatic, and was treated accordingly. I have had a dozen men standing on the banks of the river, hooting and calling me all sorts of names, and they would break any of my apparatus that I was experimenting with, if they could do so without my seeing them. I have lived to see the day that I am not called a lunatic in the above mentioned places.

I believe artificial propagation of fish-eggs will be practiced for all time to come, and all our rivers and lakes, great and small, and the ocean, will be stocked equal to the best, by the above method.

Pomological.

PRODUCING AND MARKETING FRUITS.

MR. J. M. PATTERSON, one of the most experienced, practical and successful prune orchardists in our State, writes the following chatty and instructive letter about producing and marketing fruits. He knows whereof he speaks in this matter, and his word may be regarded as authority:

EDITOR AGRICULTURIST:—I noticed in the November number, Mr. Settle's experience in fruit drying with the Alden fruit dryer. I think at the time I made out that the Drying Company made five hundred dollars more than the producer on the Petit prune. Now I think that amount ought to have been divided between the producer and the dryer, as one cent and a half is pretty low to pay for our fruit. I wish, also, that Mr. Settle had given the price of land, and how many years it took those trees to come into bearing to bring the amount there stated per acre; also, the interest on the money invested in the land, and what could be raised between the trees until they came into bearing. It would have been what a great many who are coming here want to know. I think none of the land those prunes were raised on could be bought for less than four hundred dollars per acre, unimproved. I had the privilege of examining the prunes after they were dried, and pronounce them a good article—the best I ever saw dried with hot air. They ought to bring not less than 15 to 20c per lb., as such retail for 25 cts. per pound. There ought to be three or four such dryers in San Jose.

I dried quite a lot of the Petit prune in the sun, also the Gross prune, that were too ripe to ship to San Francisco. I will send you a sample, and would like to have your better half break them open and examine them before cooking. They must be put on the back of the stove, to simmer, they should never boil, as they were ripe; boiling spoils the flavor.

Some object to sun-dried fruit, as the worms get into it. I have kept such three years and no worms ever got into them. Keep out of a sack, out of the house, away from moths, in a place where the light and sun can get in, and there will be no worms in sun-dried fruit. To be sure, I let on steam from a boiler for a few minutes before packing; this makes the fruit look nice, and destroys any larvæ that might be there. I don't want it understood that I have anything to say against hot-air dried fruit, as we want more of it, and dealers only want to know where they can get a supply for their customers.

A great many are crying: "The fruit business is overdone." Why, Mr. Editor, we as a State are only in our infancy in fruit raising. First raise the right variety for shipping, then put it up in good shape for market and it will always sell. I noticed a great many of our papers this year told about so much fruit rotting on the ground. I think I had not over one box go to waste this year of the immense crop I had. I got, even in September, when the market was glutted with fruit, one dollar a box of 20 lbs., for the

FELLENBERG PRUNE.

In speaking of this variety, I would say they will ship East without being wrapped in paper; only put a sheet of paper between the layers, and they will keep three weeks after they arrive there. This has been tested this summer, and as soon as the people East find out its qualities, there will be a large demand for it. For drying, there is none better, as it pits nicely, being a free-stone, and of excellent flavor. The

GROSS PRUNE

Is also saleable. Although a cling, yet with Mr. Tarleton's pitter this will pay well to dry, even should the market get glutted with them. On my trip East this year I took a great deal of pains in making inquiry which variety of plum or prune is in most demand. The answer always was, THE GROSS PRUNE, as it was the largest size. This year this variety has been tested and will carry nice and in good order by freight train, always admitting that they are just right and beginning to color when picked, are handled carefully, and are a No. I article.

Here let me say, Porter & Brother, Chicago, get fifty cents per box *more* than any other shippers East, as their fruit is all selected. This is almost enough above the average to pay the producer for the fruit! I would also say, they do not want dried prunes East with pits in, They want *pitted* fruit, and a No. 1 article, and there is no end to the demand for best dried prunes. There is too much poor trash dried and put on the market. There is no use of having a poor article. Graft the trees now bearing poor varieties, and in two years you can have a No. 1 article.

There is no use in orchardists in Santa Clara valley raising early pears, or Bartletts, for shipping East, as they are too late, and come in competition with the peach market. Here, for profit, we must raise *late* pears—a few varieties only—Winter Nellis, Easter Buerre, and Beurre Claergeau. The Easter Buerre must have soil adapted to its wants, as they don't do on every soil. This can be ascertained before planting from those that have them. The Easter Buerre stands high in market, as they are large, and can be kept through the winter in cellars and ripened up as wanted. They must be produced in the coast counties to keep long. I found Bartlett pears selling East for California pears that were raised in the Southern States. One glance showed that they were not California fruit. We should produce nothing, and put up nothing, but A No. 1 articles, either dried or green.

BEST VARIETIES.

For shipping, a few varieties only. For drying plums, the Columbia and Gen. Hand. Prunes, the Gross d' Argen and Fellenberg. The Petit they don't want East, owing to its inferior size. The best plums for canning to ship East are the Green Gage and Magnum Bonum. They paid me at the San Jose Canning Factory, in '76, one cent per pound on the tree for Green Gage—not very encouraging. Magnum Bonum two cents per pound. The reason of this is, the canneries put up the Imperial Gage, a very inferior article, and mark it Green Gage. Of course our eastern merchants will soon find that out, as I found some had already. Such a thing, Mr. Editor, is what is going to put a damper on the fruit business.

I saw a few days ago some Green Gage plums that were put up *in London* and shipped to California! and the cry is, "the scarcity of money and the hard times." The same can be said of raisins, nuts, and all kinds of fruits. This State can raise all such things to supply all of the United States, and will, as soon as the farmers East can take their *greenbacks* and come here. That is all they are waiting for. Nearly every one I conversed with East, told me that was the trouble about coming here. Here is a chance to settle the Chinese question. If our government is not better than gold, it is not worth much.

I noticed an article in the San Jose *Mercury* of December 23d, from the San Francisco *Bulletin*, saying that old-time shippers objected to the

REFRIGERATOR CARS,

As what fruit that would pay to ship East could be shipped in the common cars, and would do away with the ice. As far as pears are concerned, they will go very well; but for peaches, plums, apricots, prunes, and grapes, it will pay to send in ice, and the ice can be put in at the stations while the cars are oiling up, say three or four times between here and Chicago. I took the trouble to enquire at the stations the price of ice, and find it can be bought, after being iced on starting, on an average at $6 per ton. If put in at different stations, ten tons of fruit can be carried in a car with ice. The fruit should hang on the tree until nearly ripe, and can be carried through at a temperature of from 34 to 35 degrees, and if obliged to lay on a sidetrack for some time it will make little difference as long as the ice is kept in. I mean in the refrigerator that was on exhibition at the Centennial. Allegretti, an Italian, is the inventor, and I understood that Wheeler & Wilson, the sewing machine men, were helping with means to introduce it. The fruit carried in this refrigerator car will have its natural flavor when its gets there. This refrigerator has no blower, and as for the fruit sent in ice not keeping after it arrives there that has also been attended to, and there are stores prepared with refrigerators where the cars can run alongside and discharge. A sample of the fruit can be seen by buyers. So don't let us hear that the change of temperature is too great for fruit to keep after it arrives, as it can be kept almost any length of time. The only trouble is to get the railroad company to put the freight down so low that trains of these cars can be run over the road, and the merchant can sell the fruit so low that the people can afford to buy it. Here is where the trouble now lies. For instance, prunes that sold in San Jose for 50 cents per box of 20 pounds each, I saw sold East at from four to five dollars per box. Pears worth here 70 cents to $1 per box, sold there at $6, $7, and $8 per box. I mean a No. 1 article.

REMARKS ARE USELESS.

Of course it will take some time to regulate these things. When freight gets to Omaha it is all right as to time, as there are four companies waiting and anxious to get the first hold. Even the passenger trains are switched off and the cattle cars go ahead, there is so much competition to get freight. Those companies are willing to pay a fair rate per mile to bring these cars over the C. P. and U. P. roads.

Public Economy.

THE PEOPLE'S BEST INTERESTS

IS it not of as much, or more importance to the producing masses, that we have an economical and just government, as is the knowledge of how to produce wealth? Of what advantage is wealth to the man who has produced it, not for himself, but for some money lords who hold him as completely in their power as though he were their slave? Is it not time that the people become awake to the great issues of the day, and comprehend the true condition of things as their own interests are affected? Is it not time that we all strive to inform ourselves as to our duties to ourselves as citizens, and to our government, which means to our whole people?

As sure as a free and just government depends upon the people themselves, so sure are the people responsible for all the wrongs and abuses that they will either tolerate, submit to, or neglect to correct. We have faith that there is enough virtuous desire for a good government resting with the people, to correct the evils that have grown into power, if the needed intelligence upon such matters be sought, and the facts of our present condition and needs be comprehended.

We propose to devote a department each month to this object, believing that it is our duty, and the desire of the honest masses.

Must the People Starve.

"A note of discord in the festivities of the holidays. The wolf gaunt and hungry lingers round the doors of hundreds of our city homes, and stalks grimly behind the garish show of wealth on our streets.

"There are 10,000 people out of work and bread in this city, with nothing in the world to keep soul and body together. It is a stern grim fact that *will not down*.

"The notes of suffering, at first heard faintly are harsher and louder."

The above is from a Buffalo, (N. Y.,) paper, and a similar cry is echoed from every city in the Eastern States.

And this breaks in upon the music swelling merrier and louder in the halls of revelry in our national capital. Here in the frozen winds of winter flutter the thin rags of the starving multitudes. There, the only care is a rivalry in diamonds and laces, wines, costly as Cleopatra's pearls, cordial, flowers worth the homes and lives of many an American citizen; luxury unbounded.

Salaries are still too low for our officials. Some new tax must be contrived to wring a little more from the aching hands of toil. On with the dance! Draw the silken curtains; shut out the groans of the hungry; feast your eyes on the glitter of costly apparel. Hush! Hark!

You have mistaken the time for imperial usurpation and costly display.

The people are patient, very patient with the ridiculous follies of our Republican apes of royalty, but it has come to earnest crime: all this robbery of the people has come to *murder*; yes cruel murder at last, by the most miserable of deaths, starvation.

Famine cannot be chained by statutes. Never say "It is not I." Thou art the man.

The millions of money the toiling multitudes have paid to bondholders would have saved them this great wrong: not only the pains of hunger, but the humiliation of becoming the recipients of doled out charity. Oh if you, and you Congressmen, could only be compelled to live, day after day, on the scanty dole of soup, pompously dealt to your outstretched, begging hand, it would be but poetic justice!

What did you do? You sold, mortgaged the toil of the people, the industries of the whole country to the moneylenders, for a *bribe*. Thieves, swindlers, *you* have robbed toil of its just returns, and yet you dare appeal to the people who are your victims to keep your part of the contract with your bribers, and yet farther to starve and toil to make good your promises that no money but gold shall be legal, and they who have the gold to sell are your masters.—*Oakland Cal. Legal Tender.*

THE grasping gold lords of Europe govern this country in all things which affect their interests, and it is to their interest to be continually "on the make." They have succeeded in demonetizing everything but gold, and they control all or nearly all there is in the world of that, or, in the slang of the day, they have 'cornered" it, and now have laid their plans to control or own every other production or kind of property, and direct the legislation of the States in such a manner, through the instrumentality of bonds and banking institutions, as to absolutely, for all practical purposes, own the country.

The Future Legislation of the Country.

The people of the United States are oppressed to death with taxes, tariffs, high rates of interest, patent office royalties, and monopolies created by class legislation by the Federal and State governments.

No people on earth are more governed and pay so high for it. It costs every American citizen in our States about eighteen dollars per head for the privilege of living in the country one year, This is a grievous burden to put on every man, woman, child, Indian and negro who claims to be a citizen. It takes, consequently, about eighty dollars to every head of a family to clear his tithes for being governed. In England, the people, on the same basis, pay about six and three-fourth dollars per head; in France, seven and one-fourth dollars; in Prussia, about eight dollars; in Austria and Russia about eight and three-fourth dollars.

The exports of the United States, which represents the surplus of the country, is in round numbers about six hundred and forty-five millions of dollars a year—that is, the entire surplus of the country only pays about ten months of taxes, and leaves two months each unpaid for. This two months' deficit, or one hundred and twenty-two millions of dollars, is obtained by the moneyed tax receivers, who are to be bond holders, by forced sales of lands, houses, mules, horses, cattle and other property each year. It is not at all astonishing when we view these figures that we hear "hard times," "hard times" repeated everywhere among the laboring classes.

The tax burdens are not much more oppressive to the working man than the unjust tariff laws that forces every man to give a full tithe of his labor to certain pampered industries, under the pretence of protecting manufactories. But even the tariff is less burdensome than the royalty taken from the people each year by the action of the patent office laws. The people pay royalty enough each year to pay off one-fourth of the national debt.

As they suffer from the patent office laws, so they equally suffer from other monopolies, among which are giant railroads and national banks, each of which every year rob the labor of the country of enough to pay the interest on the national debt twice over.

But perhaps the most grievious evil of all is the high rates of interest allowed in the different States for the use of money, and upon bonded debts and accounts.

The injury to the laboring classes from this source are absolutely appalling. A moneyed aristocracy has already grown up in our New World, through the influence of usurious laws, which in power has now become so great as to sensibly influence every branch of our law-making machinery. The judiciary, by this same money power, is so far influenced that it is next to impossible to get a decision on any constitutional or statutory question which is detrimental to the interests of the money cliques and dealers of the nation.

Now, what the peopled want, above all things else, is reform on all these points, and the subordination of the moneyed cliques and monopolies to the public good.

We want, as nearly as we can get it, free trade, low taxes, a sound national paper currency, with no issues of money except by the National Government. A patent office wherein all royalties on inventions or discoveries shall be controlled by law, and a rate of interest or usury not to exceed in any State of the Union four per cent., or the average net gains of the leading industries of the country.

It behooves our voters everywhere to study these questions attentively, and then to act wisely, and then to see that no man is elected to any law-making office unles he stands pledged to carry out the views which are to benefit the great working classes, and not the moneyed sharks of our large cities. We do hope the people everywhere will think well on every vote they give hereafter, until low taxation, low rates of interest, free trade and just laws, administered with rigid economy, will make us the most prosperous and wealthy people on earth.—*New York Mercantile Journal.*

A GREAT WANT.—"A great want of cheap labor." What for? Why, quite a number of capitalists are hankering after the proceeds of other men's toil, and if men earn enough to live well they get strong and saucy. It is better to have gangs of weaklings who will work for little and remain too hungry and abject to desire a voice in the government! There is a great want of servile, cheap, embruted men—a great want of cheap labor! Who wants it? Is it the working men? They are the majority, and should have the say-so.—*Legal Tender.*

ONE HALF the world is not spurred and booted to ride the other half. The half which would stand back with folded hands giving words of command are cheating themselves when they endeavor to cheapen the wages of the other half. They are really in doing so sowing the seeds of their own destruction. Nothing is so dangerous in society as the ignorant class. Cheap labor means cheap food, which dwarfs men morally and intellectually. Cheap labor forces men into ignorance, which is the mother of vice. Cheap labor means that the tax for support of penitentiaries must be increased; that reform schools shall multiply. We not only do not want cheap labor, we want less hours of it. Cheap labor brings in its train of evils a disposition to grab large tracts of land. Cheap Chinese labor will make rich men richer and poor men poorer. For perfect development of the race each man must labor, each man must do his individual share in the muscle work of society. There ought to be no mudsill. It cost this country thousands of lives to destroy the system of slavery in this country, which was built up on the mudsill theory. If in a community of 100 citizens 50 arrogate to themselves the brains and seek to control the muscles of the other 50, they will in the end either have an abject race or they will have revolution.

The Vineyard.

INDEPENDET OF DROUTH.

A PRODUCT that is not affected by the drouth, on this coast, one that can be relied upon in any season, is something that, on this account alone, should commend it to the attention of farmers generally. The grape vine will flourish equally well in wet or dry years, and the fruit is even richer in sacharine qualities in dry seasons. A good vineyard on every farm would be a source of profit at all times, and to be relied upon when all other crops fail. The value of grapes for food while fresh, and put up fresh in cans, and cured into raisins, is not yet generally appreciated by our people. In some parts of Arabia, grapes are often the principal food of men and domestic animals. Long journeys are performed by men and horses with little or no other food. There are few single products of greater value as food than the grape, containing as it does all the elements of nutrition needed to sustain life and strength. A good raisin vineyard on any farm, where grapes will do well, can be made to pay as well as or better than any crop upon the same acreage, and while civilization exists there will always be a market for raisins at good paying rates. With such a vineyard, of fair proportions, no matter how dry the seasons, a farmer need never be without a revenue that will insure him from want.

We will here call attention to the matter of planting vines, especially to raise grapes for swine. These could be cultivated in convenient places in grain fields where hogs are pastured and fattened. If the porkers can have grapes to run to while fattening on the grain, they will increase in weight much faster, be healthier and make better pork, than upon dry grain alone. The common Mission grape would probably be as good as any for this purpose, as the vines are vigorous and the production of rich fruit is large. Whenever we go out among the farmers, it is a wonder to us why the majority of them have no orchards or vineyards. It seems as though they have not yet commenced to know that they are in a civilized country and have the power and right to partake of fruits "under their own vine and fig tree."

If the season prove too dry to plant an orchard, plant vines anyway, this season, and have a vineyard of your own. Cuttings should be planted deeper in a dry than a wet soil, but will grow if properly planted.

A Model Raisin Vineyard.

Says the Stockton *Independent:* We recently paid a visit to the vineyard of the California Raisin Company, in Placer county, a few miles north of Rocklin. The company started some three years ago among a number of San Francico capitalists, who propose to test to the utmost the capabilities of California for producing raisins, and in order to do everything with all proper thoroughness no money has been or will be spared in perfecting all the conditions for success. The first step was to lease a tract of land in a favorable spot for fourteen years, the owner of the land taking one-fourth of the stock, and, as President of the company, overseeing all the arrangements. The spot selected could scarcely have been better. It is a long, narrow valley, with a southwestern exposure, surrounded by high hills that completely shelter it from severe storms or high winds. When the company began work the valley was covered with a heavy growth of oak trees, which required to be cleared away. They first commenced with 225 acres, which they surrounded with a rabbit-proof fence. On the hillsides above the fence a berme ditch was dug to prevent the storm waters from deluging the vineyard. The plowing was most thoroughly done. The first breaking was done with a single plow to the depth of eight or ten inches. It was then cross plowed a little deeper, and followed up with a subsoil plow that stirred the ground

TO A DEPTH OF TWO FEET.

It was pretty well pulverized by this time, but it was then cultivated and harrowed. The value of this treatment is manifest in the fact that at the time we visited the vineyard, just before the first rain of the season, when there had been no rain or dew for six months, we could kick up moist earth but a few inches from the surface, and the soil was light and fluffy, while in the same soil just outside the vineyard one might dig down to bed-rock without finding any moisture. This thorough plowing was given three years ago, and it has never required anything but light cultivation since to maintain the pulverized, loamy condition of the soil. The soil, which is about six feet deep over the rock, is doubtless formed of disintegrated granite, enriched by the growth of the trees upon it. After this thorough preparation of the soil the vineyard was carefully laid out for a convenient

RAISIN VINEYARD,

By leaving about twenty acres for drying ground in patches of about one acre each, taking advantage of every knoll with a sunny exposure. The vines are laid out with the utmost precision, the rows being eight feet apart and as straight as a chalk mark, with roadways of greater width at short intervals. The vines selected, which were started from cuttings, are of the variety known as White Muscat of Alexandria, which they consider the best for raisins. Many of the vines bore fruit this year, and next year the company can begin to dry raisins. The preparation of the drying grounds is the next consideration to be

attended to, and will involve considerable expense. The plan to be adopted is that pursued in Spain, the home of the raisin. The grounds are to be subdivided into comparments of perhaps 8x16 feet, each to be surrounded by an adobe wall abont two feet high, the floor to be prepared and made smooth with adobe, and each compartment covered with a canvass drawn over at night. The adobe will thus retain the heat of the sun during the day and by covering it up the heat will be longer retained and the raisins continue drying through the night. This vineyard has already cost about $70 per acre, and will perhaps cost $30 or $40 more before any revenue is derived from it. The experiment on the thorough and extensive scale pursued in this undertaking is an interesting one, and if successful should be eargerly watched by all the vineyardists of the State. There is one lesson shown by the lusty growth of the vines and the moist and pulverized condition of the soil throughout the year, which can be of use to every farmer or tiller of the soil in the State, no matter what his occupation, that is, the dread of drouths can be obviated by thorough cultivation of the soil, and the urgent need of irrigation can in many places be entirely done away with by thorough and deep tillage.

MAKING RAISINS.

There is much encouragement in the good results of attention to the business of the past season or two, to believe that the raisin-making interest will soon be one of the most important industries of California. Mentioning the failure of the San Joaquin foothill vineyardists to find profit in wine making, the Stockton *Independent* says: During the last two or three years, however, several owners of mountain vineyards have turned their attention to the production of the raisin grape, and in most cases the experiments have been successful. We lately visited the ranch of L. F. Jarvis, near Columbia, Tuolumne county, and saw a large quantity of raisins made from this year's crop of grapes that would compare favorably with the imported article. Mr. Jarvis finds that he White Muscat grape is the best for raisins, and he this year raised about ninety tons of this variety, all of which he converted into raisins by drying the grapes in the sun. He has extensive platforms erected on the hillside, sloping toward the south, on which he spreads the grapes, and if the weather remains pleasant nothing more is necessary until the grapes are dried ready for boxing. In case of early rain, such as we have had this year, he is prepared to throw a temporary roof over his platform to protect the drying grapes from the storm. His grapes have dried without any difficulty and the raisins produced will sell readily in market. Mr. Jarvis is, however, of the opinion of most of those advocating the developement of this industry have overestimated the product of raisins from a given quantity of grapes, his experience proving to him that it will take about five pounds of grapes to make one of raisins, yet the grapes are then more valuable for raisins than for anything else.

Cannino beef is becoming quite an important industry in Oregon and serve to keep the salmon canneries employed during what would otherwise be the dull season. A corespondent of the *Oregonian* says: The Cutting Packing Company are packing beef in cans. Under a contract from England, they are packing daily from 40 to 50 beeves supplied by the Portland slaughterers.

Educational.

Boil it Down.

Whatever you may have to say, my friend,
Whether witty, or grave, or gay,
Condense as much as ever you can,
And say it in the readiest way;
And whether you write of rural affairs,
Or of matters and things in town,
Just take a word of friendly advice—
Boil it down.

For if you go spluttering over a page
When a couple of lines would do,
Your butter is spread so much, you see,
That the bread look plainly through.
So, wh-n you have a story to tell,
And would like a little renown,
To make quite sure of your wish, my friend,
Boil it down.

When writing an article for the press,
Whether prose or verse, just try
To settle your thoughts in the fewest words,
And let them be crisp and dry;
And when it is finished and you suppose
It is done exactly brown,
Just look it over again, and then,
Boil it down.

For editors do not like to print
An article lazily long,
And the general reader does not care
For a couple of yards of song;
So gather your wits in the smallest space
If you want a little renown,
And every time you write, my friend,
Boil it down.

THE FREE AND INDEPENDENT NEWSPAPER.

BY A. GAYLORD SPALDING.

DEAR EDITOR: You will please accept the friendly greeting of a once active typo brother, now for some dreary years prostrated by cruel calamity, and laid on the low couch of helpless retirement. An editor is apt to find "Jordan is a hard road to trabel, I believe;" especially if he ventures to run a wide-awake, forcible, free and independent, greenback, labor reform, temperance journal, in a new country, of wild land, wild game, and fast people, against the rushing tide of blind and reckless money power and popularity, amidst the dense fogs of party and sectism, ignorance, prejudice, antiquated custom and old Madam Grundy; and he naturally craves the warm sympathy of his fellow craftsmen, and of all high thinking minds. Who can possibly ever be a bit free and independent, or how shall we win our honest bread and butter? It is a serious conundrum.

It takes a hero for a pioneer in the type wilderness, as well as with the plow, to break the grubby field, and no puny or timid hand can ever accomplish great things. Few have the nerve to strike.

And realizing this most discouraging fact, you probably, at the outset, counted the heavy cost, and made up your mind for manly struggle and a valiant battle. We fight the idol-gods of party, sect and monopoly, in defense of

LABOR AND THE WORKINGMAN.

The newspaper is a universal necessity, if Hottentotism is not the settled law and gospel; and, wherever you find refinement in society, with mental development and moral rectitude, and external polish and attraction in houses and lands, you may be quite sure the good newspaper is scattered freely around.

And, furthermore, if new departures are opening up, on finance, trade, politics, government, social philosophy, science, sensible religion, temperance, woman's freedom, Sunday freedom, and labor reform, with a new century, new clothes, new ideas and new "everydings" to correspond, it is pretty evident that the lively, audacious, independent, truth-telling editor is making things boiling hot generally, and stirring up the dry bones of rusty old-fogyism, ancient hard-shell superstition, Beecherism, bloated and rotten monopoly, and supercilious, self-styled uppertendom. So, if your toiling millions are proud of themselves, and of their homes and country, and ambitious to shine and excel in the elements of true civilization and laudable aggrandizement, they will be very proud of your heroic and beautiful magazine, and subscribe liberally and write abundantly. Come on, then, friends; come on *now!* Your clean, bright and burning columns, never choked up with fawning toadyism, party cowardice, selfish compromise, or bigotry or prejudice of any kind, will welcome and encourage a most free and fearless correspondence, which should characterize all American journalism in the present glorious opening new century of our proud national history.

I place the newspaper, always, at the very head and front of every public enterprise and institution; and, say what you will of professions or professional men, in any department of civil life, ers, the newspaper ranks far above and outdoes them all; because it comprehends, includes and represents them all. It is king of kings and lord of lords; for it is, indeed, the brains of the world, condensed — a real live schoolmaster abroad, and mighty educator in every family, as well as

PREACHER, LAWYER, AND DOCTOR,

And missionary at large. It is, in fact, the grand brain ventilator and brain thermometer of all humanity—mental, moral, and social—and is *so extra cheap*, that none but very foolish or careless men or women will ever consent to pay any professional fee, or kiss the great Tox: because the really sharp, free and independent newspaper naturally makes every live, earnest and wakeful reader also independent. Then read, read, read, every one, and think, THINK, THINK!

Wonderful upheavals, evolutions and revolutions, are marking our period, with the convulsive throes of regeneration, gestation, and a new birth, social and national. It is the

WORLD'S MIGHTY LABOR EPOCH,

And the working class everywhere, (the true, practical democracy,) are called to dignity, honor, self-respect, and a spirit of independence.

Human toil is no longer classed with the forced draft of the horse and the ox, but is the voluntary choice of the highest manhood, which scorns the sneers of haughty wealth, pride and ignorance, and stands up independent — making *labor*, not money, the enduring cornerstone of all government and society, and the chief virtue of all politics and religion.

Workingmen and women claim all that salary-grab presidents, or congressional, or cabinet, or lobby thieves steal, eat, wear and waste; and may the time soon come when the blue-blood money aristocracy must step down and out, because it will be out-voted. All the world belongs to the workers, and the shining newspaper is their

GRAND GABRIEL'S TRUMPET,

With *co-operation* for the magical password! The best interests of honest men and women will be advocated, and the evils that oppress us will be as boldly attacked. Let real reform be triumphantly advanced. So, now, bravo for the rushing nation emancipated! Dear, toiling brothers and sisters, just save up your loose dimes, and subscribe at once for the free, brave and independent newspaper—the

CALIFORNIA AGRICULTURIST!

It is now the bright morning of the new century and of new-born independence, and the happy year of jubilee for independent manhood, independent labor, independent temperance, independent religion, independent greenbacks, and independent farmer's and workingmen's homes.

Champlin, Minn., Jan. '77.

Farmers and Newspapers.

I have been frequently surprised to see how many well-to-do farmers neglect or refuse to take some good newspaper for the benefit of themselves and families. They seem to think that they have no interest in the doings of the outside world; that they have to deal with nothing except the land they plow, the stock they feed, and the children they are rearing in ignorance. They forget that they are a part of the great human family, placed upon this orb to work out the plans of the Creator, and as such have no right to dam up the stream of progress. The laws of progression are as unalterable as are any others in nature, and that man who impedes these laws with an offspring of uneducated children, remains a sin which reacts not only on himself, but on his descendants for long years in the future. Newspapers are made to spread intelligence and improve morals. To the farmer, above all men, they should be a necessity, from the fact that they afford him in his isolated condition the only means of mixing in the busy scenes of life. Man in a hermit state becomes a personification of selfishness—caring for nobody and nobody caring for him. Development comes alone from associating with our fellow men, and appropriating to ourselves the advancement which they make. No farmer should do without this social schooling, both for his own good and that of his children. In no other way can he obtain it so fully and so cheaply as through the periodical literature; and he who neglects to receive these advantages deprives himself of light, and lives out his days in worse than heathen darkness.—*Otis Tinkham in Country Gentleman.*

Knowledge is Success.—Every man must feel that the greater the amount of knowledge he can bring to bear on his business, the greater will be his success, provided the same exertion is used in the one case as in the other. It is absurd to say that it is a disadvantage to one's business to learn all he can about his business, and yet there many persons who maintain that reading about farming is of no profit, though the same persons will ask and follow the advice of competent farmers in their own neighborhoods. In other words, according to them, the advice is good if communicated orally, but if conveyed through a newspaper it is worthless. This unreasoning and senseless prejudice, we are glad to know, is rapidly passing away, and many men who, ten years ago, felt an opposition to and scoffed in derision of agricultural works, are now the most ardent supporters of them. As the light of knowledge advances, the clouds of ignorance, error and prejudice are dispelled, and science, with its ever-widening and ever-varying horizon, throws forth light upon every department of human industry, and most of all upon the business of agriculture.

Mothers are the Real Teachers.—They have in their hands the moral guidance of their boys till the latter are at least twelve years old, and of their daughters till the latter marry. If mothers do their duty, their sons, in all but exceptional cases, will grow up good and honorable men. It is because lads

are not taught at home, and taught by example as well as by precept what is noble and right, that they so often go astray. But even if there is some excuse for a son not turning out well, there is hardly any in the case of a daughter. Bring up the girl to be a good wife and mother; give her the solid acquirements that will enable her to fill those positions properly, and she will make herself and others happy. But devote too much time to mere accomplishments, and you render her vain and frivolous. Of course, a girl ought to know how to attract as well as how to keep; how to win love as well as to retain it. Do not, therefore, make her too prosaic. But on the other hand, remember that accomplishments are not everything.

Hygienic.

HOW I TREATED MY BABY IN DIPHTHERIA.

BY "JEWELL."

OURS was a very bad and dangerous case. The baby, only seven months old, when first taken with sore throat was feverish and fretful. A hot bath, flannels about the throat, and a day of quiet and careful nursing—keeping him as comfortable as possible—seemed to break up all symptoms, and the little one appeared well. A change of weather, and the little fellow took a severe cold, and three days after, the diphtheria in a most violent form—a relapse—was the result.

Even now I tremble as I recall the days and nights of anxiety and watching,—yes, and prayer, too—for guidance to apply remedies best suited to the symptoms, and in this way save my darling's life! Having been successful in one of the worst cases, complicated with inflammation of the lungs, I feel it a duty to tell other mothers, that they may do likewise, in case of like disease, and save the lives of their children, perhaps, for few doctors are successful in the treatment of diphtheria, and *everything* depends upon the careful, discreet nursing of the mothers, after all.

To begin with, watch your children closely, and if the throat begins to swell or the glands behind the ears, and under the jaw, apply hot fomentations of salt water.

A THROAT WRAPPER

Of flannel, made by sewing one or more square pieces of thick flannel to a longer piece, so as to go about the neck in the form of an apron is an excellent thing. Under this you can apply either cold or hot as the case may be. Two are needed that one may always be dry. In fomenting use flannel wrung out of hot water. By placing a towel outside the wet cloth you will find your hands will not come in contact with the heat as you wring it and it can be wrung much dryer. It is not the moisture so much as the *heat* and *steam* that we want. In cold applications use old linen—wring dry, and apply frequently—of very cold water.

See that the feet and hands are kept warm —give a hot bath (103°) once a day, and if there is much general fever, a sponge off under the clothing with tepid water is very refreshing.

Don't fail to give the child, or even a nursing baby, *plenty and frequent drinks of cold water*. My baby preferred water, ice water at that, to the breast, and when I could hear the phlegm rattling in the throat and a difficulty of breathing, I would put a piece of ice in his mouth, which would gag him and make him throw up. Be ready then to take all the mucus out of the mouth with the finger, as infants have a tendency to swallow everything in the mouth. A very good gargle is made of borax water, salt water or chloride of potassia water, with one-half glycerine. Make a swab of soft linen, tied on the end of a penholder or stick, and after swabbing the throat out every two hours or so, rinse the swab in fresh cold water before putting back in the gargle mixture—no matter if a little is swallowed.

Complications of various kinds will occur. Retaining the urine, or painful urination, is one, for which use hot fomentations over the bladder, or dry *hot* flannels, are good—also, use a tea made of steeped watermelon seeds, which is simple and effective.

I would be impossible to enumerate all the symptoms of diphtheria in this article, as they vary according to the condition of the patient; but most mothers can read the symptoms in their little ones if they will be watchful, and a very safe way to do is to give a *hot bath*, no matter what ails the little one, and next an injection of tepid water, thus freeing the skin and bowels, then wait and see what symptoms follow. *Keep the child quiet and let it sleep all it will.* For two weeks we did not speak aloud where our baby was. *Keep the temperature even*, about 70°, night and day, though have abundance of *fresh air without draughts* in the apartment.

Let there be but one nurse, and plenty of *assistants*, that she may be waited on, and be able to sleep when the patient sleeps. Above all, keep up good courage and have *faith*. *Remember, drugs do not save life*—it is good nursing and care. The best of physicians admit this.

When the fever was finally broken, the perfect prostration was like unto death in appearance. An abundance of pure air, warm clothing and wrapping, keeping the feet and hands warm, and allowing the child to rest, was all we could do—all that was then necessary. Aiding nature, by making all conditions as favorable as possible, is proper treatment in any case. Depend upon good treatment, not medicines, and there will be much less danger of loss of life from any class of diseases.

1776—"Farmer at the plow, wife milking the cow, daughter spinning yarn, son threshing in the barn, all happy to a charm."—1876—"Farmer goes to see a show, daughter at the piano, Madame gaily dressed in satin, all the boys learning Latin, with a mortgage on the farm."

WORK has commenced on a canal thirty miles long and 120 feet wide, for irrigation and navigation south of Tulare Lake. The grade is to be an inch and a half to the mile, but half an inch would be much better for the preservation of the banks in a soil of sandy loam. It is to irrigate 60,000 acres of land, and is to cost $150,000. There are few places where so many acres can be irrigated at so little expense.

THE results of irrigation along the Fresno river near Borden have been satisfactory in the highest degree, and tend to prove the wisdom of the policy of flooding the land with water in the winter season, when the rain falls are light. It is the belief of farmers who note results carefully that the system of irrigation is gradually working a change in the climate, by producing heavy dews at night and adding to the moisture of the atmosphere throughout the dry season.

Household Reading.

FAMILIAR TALKS---No. 2.

BY M. E. T.

"OUT OF THE WILDERNESS."

WELL, here is hope at last," said Annie, lifting her tired hands, and emphasizing her words by a downward thud on the open pages of the AGRICULTURIST. Poor child, she had been working hard all day, and was just then enjoying a momentary rest.

"Yes," I said wearily, and sought for myself a more comfortable position on the lounge, "is it some sure and speedy cure for diptheria?" for I was very sick and had a bad sore throat, and was consequently thinking more of that than anything else. For answer, she read me from Luip's pen January number, "To Toil and to Spin," and, in conclusion, she said:

"I shall certainly call into exercise this wonderful power of which, at present, I am so ignorantly possessed. I hope the editor, for the sake of suffering humanity, will permit our friend to tell us how this great remedy is made practical. I am only twenty and already gray hairs are found on my head—hairs that 'caring cares, baffled hopes and chilled aspirations' have whitened before their time."

The door opened and shut. I heard click of dinner dishes, and knew that the the tired hands were again busy. My thoughts ran back over the dear child's life, so kind, so patient and true. I thought of her cherished hopes and desires, of her consuming thirst for knowledge, of her love for everything beautiful, her lofty ideas and sensitive nature, and I did not wonder that the signs of warfare were visible, fighting as she does against such mighty odds, and still this brave girls says, "I thank God that I am what I am," and goes on working and struggling and hoping.

That these things are all right and best I know not; but I do know that uncontrollable circumstances are shading a thousand brows to-day, no doubt many of them young and fair, while we are powerless to direct them, simply because we can see from but *one* stand-point, and that one *our own*. Then I think we all know that children must suffer for the sins of their parents. My pitying heart tells me that there are hundreds of fair Southern maidens, bright in intellect, whose prospects are blighted through no fault of theirs.

Go back through generations and let history show who thrust the curse of slavery upon our fair land. No doubt, had slave labor been profitable in northern States, we should to-day be equally guilty. While I thank God day and night that such a wicked practice no longer exists, I can feel in my heart only pity for those Southern people who have yet to learn what our Northern people are bred and born to, viz: to help themselves; but so far as I know I think our Southern sisters are doing wonderfully, and we should love to aid them through our advice and longer experience. It is time that envy and malice were buried forever out of sight.

As to "drudges" and ways of looking at household work, there seems to be very muddled up opinions concerning them that are more or less distressing to women everywhere, both North and South, East and West. But of course those who can bring to bear the greatest amount of common sense in dealing with the realities of life, are surest of settling matters to best advantage.

UP-COUNTRY LETTERS---NO. 10,

BY RACHEL A. ELY.

A LECTURE TO MOTHERS.

Back to the noise and confusion of the city—to the smoke, dust, smells and fogs that so many hundred endure daily and know it not, never think of the sweet mountain air, gay singing birds and elastic, untrodden grass, for carpets. Poor souls! how my heart aches for such. And another Summer, if my feet stray mountain-ward, I trust my feeble pen-sketches may so arouse the souls within my readers, that they, too, will prefer the pure, mountain air to the stifling atmosphere of the many haunts of pleasure-seekers, where the "society ways" destroy the germ of good that might come to poor, tired humanity, were it allowed. Here let me ask, why the masses so resemble a flock of sheep? If one goes to the seaside or springs, *crowds* go. One has a pin-back skirt, and forthwith dozens appear clad in like manner. Men are less imitative, and yet how many smoke or drink merely *because* others do? and the long or short coats, tight or loose pants, are but evidences of a *soft spot* in their heads, inherited, it may be, from their mothers! How necessary for each to set a good example, knowing the human preference for evil to good—and how especially, so that mothers should, as their example will live to the third or fourth generation. Poor mothers! tired, weary, anxious, overburdened mothers! Everywhere you see them, and yet I would add one more straw to their load, hoping it may break the back, and so free them from the rest—from burdens that are useless and hurtful, and come through ignorance of the true life, and pursuit of happiness for self and family. The greatest burden comes from unselfishness on the part of the mother. Let me explain: She takes the hardest tasks on herself, to save husband and children; all care and responsibility, all dirty, disagreeable work is *her* share, while husband, finding home cares few and wife never fit nor able to go out, takes one of the girls, or a lady friend, or worse still, goes *alone* to lecture, concert or club. The children stoutly decline to help, thinking drudgery is mother's work and company is only for *them*, and their part of the house and themselves must be in better order than the kitchen, and mother; and finally a feeling of disrespect grows up for the dearest friend, their, mother, simply because she can not satisfy their souls and stomachs too! Poor soul, how can she, when her hands are full to overflowing with housework; her head as full of cooking and summer and winter sewing as it can be.

And here is what I want mothers to do: Set the young folks a good example, by *planning* the work, setting the young hands to execute it. Mothers could thus keep themselves fresh and handsome, so that the husband will not be able to find a pleasanter companion nor the young folks a more instructive one, and she can be a companion to not alone her own children, but to the visitors coming to the house, so that no game nor amusement will be complete without Mother and Father take part in it. Mothers, try it. Believe me, it will keep you old folks young, and the young folks steady.

Let your children find you an agreeable companion ever, and ready to sympathize and counsel in their troubles, and you will see them ever ready to give

you their confidence. One of the greatest burdens will be lifted, and home made far happier than if poor, tired MOTHER was drudging her life away that her children might have white bands and begin life ignorant of how to make their homes truly happy and charming.

FAMILIAR TALKS---NO. 2. (New Series.)

BY LUIP.

SOME MORE "MASCULINE SUPREMACY."

I cannot quite agree with all the sentiments expressed in Inglewood's last letter. Towards the close he says he is "seeking a helpmeet in all the departments of our natures; the physical and intellectual; the moral and spiritual. Concerning the last two the supremacy ever rests with the feminine. The former with the masculine." I admit the superiority of the masculine physical strength, but that the husband must be, or is always more intellectual than the wife, I do *not* think. Were it so, the *mutual* counsel and advice would be rather a onesided argument generally. The husband would express his opinions, and act in accordance with them. Why should a man require a greater degree of moral strength in his wife than he himself possesses? I hold that one should be just as moral as the other. How can there be mutual confidence otherwise? Still, I think Grandpa did not attach this meaning to the word *confidence* here. Why should not a man be just as spiritual as his wife? But I am not quite sure I understand just what is meant by the word "spiritual" in its connection with this subject.

After the report of the seeds obtained at the AGRICULTURIST office had been sent, I saw in "Washburn's Cultivator's Guide" a statement to the effect that watermelon seeds should be two years old before being planted. Is there any truth in this?

Mrs. Wood writes of *buff Fleur de Lis*. I have the blue and the white, which is purely white; could not by any stretch of imagination be called buff. But if there is a purely *buff* variety I would like to get some. Will Mrs. W. please inform me where I can procure them?

In the December number of the AGRICULTURIST, a call was made for a report of the *sunwick seed* sent out from that office. We planted seed at two different times, but not a plant put in an appearance. A neighbor was furnished with some of the seed, but makes the same report. Is there any special treatment of the seed necessary? It is a little discouraging to send so many reports of such ill success, but "what can't be cured must be endured."

Boys and Girls.

The Minuet.

BY MRS. MARY MAPES DODGE.

Grandma told me all about it,
Told me so I couldn't doubt it,
How she danced—my grandma danced!
Long ago.
How she held her pretty head,
How her stately skirt she spread,
How she turned her little toes—
Smiling little human rose!—
Long ago.

Grandma's hair was bright and sunny;
Dimpled cheeks, too—oh, how funny!
Really quite a pretty girl,
Long ago.
Bless her! why, she wears a cap,
Grandma does, and takes a nap
Every single day; and yet
Grandma danced the minuet
Long ago.

Now she sits there, rocking, rocking,
Always knitting Grandpa's stocking—
(Every girl was taught to knit,
Long ago.)
Yet her figure is so neat,
And her way so staid and sweet,
I can almost see her now
Bending to her partner's bow,
Long ago.

Grandma says our modern jumping,
Hopping, rushing, whirling, bumping,
Would have shocked the gentle folk
Long ago.
No—they moved with stately grace,
Everything in proper place,
Gliding slowly forward, then
Slowly courtesying back again,
Long ago.

Modern ways are quite alarming,
Grandma says; but boys were charming—
Girls and boys, I mean, of course—
Long ago.
Bravely modest, grandly shy—
What if all of us should try
Just to feel like those who met
In the graceful minuet,
Long ago.

With the minuet in fashion,
Who could fly into a passion?
All would wear the calm they wore
Long ago.
In time to come, if I, perchance,
Should tell my grandchild of our dance,
I shall really like to say,
"We did it, dear, in some such way,
Long ago."

—[St. Nicholas for January.

The Boy That Laughs.

BY GEORGE COOPER.

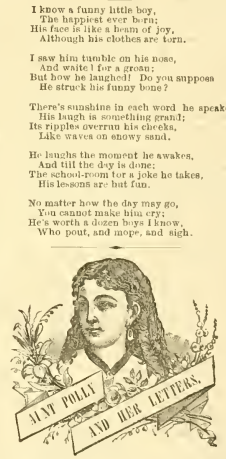
I know a funny little boy,
The happiest ever born;
His face is like a book of joy,
Although his clothes are torn.

I saw him tumble on his nose,
And write! for a groan;
But how he laughed! Do you suppose
He struck his funny bone?

There's sunshine in each word he speaks,
His laugh is something grand;
Its ripples overrun his cheeks,
Like waves on snowy sand.

He laughs the moment he awakes,
And till the day is done;
The school-room for a joke he takes,
His lessons are but fun.

No matter how the day may go,
You cannot make him cry;
He's worth a dozen boys I know,
Who pout, and mope, and sigh.



EBRUARY is Spring, in California, and particularly so this year. The late beautiful rains and warm days, have made the grass and grain spring forth in tender green, covering the valley and distant hills with loveliness. The early-blossoming flowers now grace the garden beds, the sweet violets and most delicate lillies and tube roses fill the air with delicious perfumes. We must expect some cold, windy, cleerless days yet, but really, our Spring is come.

Now, dear Neices and Nephews, plant the little seeds, and set the cuttings of plants, and plant out such flowers and shrubs as you can get, and make a little garden of your own. Papa and Mamma, or your bigger brothers or sisters will assist you, and you can see how the beautiful plants will love to grow from your hands. It is joy to watch the seeds sprout up through the soil and grow into plants, and blossom, or bear fruit.

Aunt Polly will not weary you with a long article this month. We are all glad together, and will try to enjoy this glorious Spring, and make the most of our opportunities.

And now for our letters, several of which are from new contributors:

SAN BENITO, Jan. 28, 1877.

DEAR AUNT POLLY:—I have never written to you, or thought much about it until the January No. came. When I saw your picture, I asked my mother if I might write and tell you that I had no idea that you were so pretty. I thought you were old and wrinkled, and wore a wide cap border and spectacles; and I love you ever so much now, (although I know that we ought to love old ladies too, for we will all get old if we live long enough); But I do not think much of the editor if he looks like that picture. Why, he has the *big head*. He was wise to take his umbrella, for he would need it before this time. Please publish this yourself, so he will not see it. But, mother says she thinks his artist is not so good as yours. Papa has taken the AGRICULTURIST for a short time, and we all like to read it so well that we are going to take it another year, and, I hope, always. I feel so sorry for little Amy, in the Christmas story. How lonely she must have been, so long away from her kind friends! I should have cried myself to death, I believe. I was away to Watsonville two weeks last Summer, and I tell you I was glad to get home again to see my mother and papa and little six-year-old Zena, and darling three-year-old brother, Walter. I am eleven years old, and go to school, and I could tell you a long story about our singing school and concert and Christmas tree; but I am afraid if I make this letter too long that you would not publish it, and I would like to have you do so, for I want to be One of Your Loving Neices,

EMILY W. PAGE.

P. S.—The answer to Fannie B.'s puzzle is, "Bread."

Here is a puzzle, which I have just composed:

My 1 is in ride but not in walk.
My 2 is in tongue, also in talk.
My 3 is in give but not in lend.
My 4 is in sew but not in mend.
My 5 is in river but not in lake.
My 6 is in toad, also in snake.
My 7 is in their but not in hour.
My 8 is in minute but not in hour.
My 9 is in fish but not in trout.
My 10 is in in but not in out.
My 11 is in sing but not in shout.
My whole is a great blessing, for which we should be thankful. E. W. P.

Emily's letter is rather long, but then it is so interesting that we give it all. Write often, Em.

MILPITAS, Jan. 17, 1877.

DEAR AUNT POLLY:—Wishing you a happy new year, I thought I would try and write to the AGRICULTURIST this month. We have been so busy for Christmas and New Years, that I did not have time to write.

The answer to Fannie B.'s puzzle is "Bread." I made out the answers to the others, but was too late in sending them. I received a great many Christmas presents, and I hope Aunt Polly did too. There were too of my puzzles not made out. They appeared in the AGRICULTURIST last June. The answers to them were: "Herring," and "Martha's Vineyard." If you think they are able to get the Premium, my choice would be Romeo and Juliet.

Your Neice, TILLIE.

The chromo has been sent to Tillie, and Aunt Polly hopes she will write again, and send more hard puzzles, that nobody can guess.

SANTA CRUZ, Jan. 29, 1877.

DEAR AUNT POLLY:—I thought I would accept your kind invitation, and write you a letter. I see by your paper that you give chromos to all those who send puzzles that are not answered, and I thought that I would see what I could do. I am thirteen years old. My puzzle is original. Yours Truly,

JACK.

PUZZLE.

I am composed of six letters.
My 4 you will find in will.
My 3 and 6 you will find in every.
My second you will find in cousin.
My fifth you will find in welcome.
My first you will find in Jack.
My whole is the first name of one of our family. JACK.

We think that Jack's puzzle will be a hard one to guess, and we expect he will get a chromo, sure.

SAN FELIPE, Jan. 21, 1877.

DEAR AUNT POLLY:—This is the first time that I have written to you. I am only ten years old, and my sister Jennie is eight years old, and my brother Willie is six years old. I had a nice time Christmas; we had a Christmas tree at our school house. Mamma takes the AGRICULTURIST, and I always read Our Corner, and think it is very nice. We have got a little dog, and we call her Pet.

If you think this worth publishing, I will write again, and try and do better.

Good bye, from Your Neice,

BLANCHE MCLEOD.

Well done, Blanch; hope you will let the cousins hear from you again.

SAN BENITO, Dec. 29, '76.

DEAR AUNT POLLY:—I always like to read Our Corner, so I thought I would try to contribute something. I live in Hernandez valley, on the San Benito river. I will send two puzzles, which I composed:

PUZZLES.

Take B from a city in Europe, and leave what a tired man loves to do.

Take S from a country in Europe, and leave what we all dread.

Take A from a city in California, and leave what we often do.

Take L from a river in the Western States, and leave a fruit.

Take O from a river in the Western States, and leave an herb.

Take A from from an island, and leave a young animal. M. A. S.

WORD PUZZLE.

My first is in tree but not in leaf.
My second is in hay but not in grass.
My third is in ray but not in shine.
My fourth is in new but not in old.
My fifth is in rake but not in mow.
My sixth is in lose but not in find.
My seventh is in go but not in stay.
My eighth is in bird but not in bill.
My ninth is in verb but not in noun.
My tenth is in sit but not in stand.
My eleventh is in near but not in far.
My twelfth is in good but not in bad.
My whole is something we all owe to God. MINNIE A. SHORT.

Minnie has Aunt Polly's thanks for her nice letter and puzzles.

DEAR AUNT POLLY:—I thought I ought to write a letter to you this month. I

have a pretty little pigeon at home. To-morrow a boy is going to give me two more.

With the above letter came a rebus, which Aunt Polly regrets that she cannot give, as she has not the pictures to go with it. The writer forgot to sign a name to the letter, so we don't know who wrote it.

SALINAS VALLEY, Jan., 1877.

DEAR AUNT POLLY:—I wish you many happy returns of the season, as this is the first letter of the new year I have written to you. Our Corner, in December, was splendid. I think the chromo I sent for is splendid. Also the editor's picture, with his umbrella under his arm. I am very sorry to say that I cannot send you a puzzle. There is no sign of rain in Salinas Valley yet. My two sisters and I take music lessons twice a week. If you ever come to Salinas, you will please call and see me. I hope in my next letter I will have better news to tell you, as it may rain, and that will be good news to all. Dear Aunt Polly, I would like to see your photograph. I would like to have it in my album. I will tell you what I got off the Episcopal Church Christmas tree: my sister and I got gold cuff-pins. We attend the Sabbath School there. Aunt Polly, this is enough for this time; the next time I will try to do better. I remain, Your Neice,

ANNIE WILLIAMS.

We thank you for your nice letter. Annie should be satisfied with Aunt Polly's picture in print. Glad you had such a nice Christmas; but do not let the gold pins make you proud, will you?

SAN BENITO, Jan. 17, 1877.

DEAR AUNT POLLY:—I am so glad you sent us your picture. I always wanted to see you, but now I know just how you look. I think your hair is pretty, and you have such bright eyes! No wonder you can tell us country children so many funny things, and you are right in town, where so many folks live, and where so many things are done every day, you can go to the Post Office or to market just when you wish, while we in the country do not have either to go to nearer than four or five miles, and do not go there very often. Oh yes, and the editor's picture, too. We children look at it and are glad to have the chance, but we thought he was a larger man than he looks to be, and he has such a big nose! He must have good judgment, for they say that is a sign. It has begun to rain, and we need not worry any more, but trust in Providence for the future.

You little Neice,

SALLIE MOORE.

Sallie must write again. The editor must certainly feel flattered by such complimentary remarks from the cousins.

A FUNNY DANCE.

A gentleman writing from Graham's Town, Africa, relates his observation of a curious circumstance: "We entered through a locked gate into a large enclosure or paddock, in which were fifty-eight one and two-year-old ostriches. They all looked exceedingly well, and, though they did not dance, seemed full of life. They do, sometimes, favor the spectators with a dance, and it is one of the funniest of all the freaks or habits of animals that evidence a sense of the jokeful we ever beheld. We once saw some twenty nearly full grown birds waltzing together. They began with a sort of sliding, slow revolution on their toes, moving their wings gently up and down, and presently they seemed to get into the spirit of the thing without the aid of any fiddler that we saw, and spun round at a rate that would have astonished any one but a dancing dervish. In dancing they swept round and round, without ever coming into contact with each other."

This story of the ostriches reminds Aunt Polly of a splendid lot of over a hundred young turkeys that she once saw. They were all raised together on a farm where there was nice open ground to parade on. When about full grown, they would often strut around and all form a ring and run around and jump and goobble, gobble, gobble, with as much time and fun and merriment as a troop of school children on a holiday frolic.

THE EDITOR'S REVENGE.

DEAR CHILDREN: Do you suppose for one moment that a gentleman of brains and dignity like *ourself* is going to stand any such scandalous abuse as Aunt Polly and the printers gave us last month? Not a bit of it, while we occupy the sanctum. Now we assure you that we are good looking—in fact, the best looking one in or about the office. We have turned that artist off, without a cent in his pocket, and got another one who will do our bidding.

Aunt Polly is not so handsome as her picture looks, by a good deal. But she has apologized to us for saying we are "old fogy," so we wont retaliate too severely.

Now we will show you just how she looked to us the next day after the paper came out, when she came into the office with a gay bouquet for us, and with a smile that was childlike and bland, she courtesied, with a "Good morning, sir; accept this bouquet."

LOOK AT HER!

As to the printer, who was once a Devil with a tail, like any other pollywog—a printer's "devil," we mean,—he still shows his bringing up in the bogs, among bullrushes and mushrooms. He is a genuine green-back, as green as grass, the biggest toad in the puddle, and a regular croaker at that. We will show you how *he* looked to us, as he came up with a type on his shoulder, offering us "the olive branch of peace." Isn't he a beauty?

OUR SAUCY PRINTER.

Land Monopoly.

Investigation in Order.

At a HONDA GRANGE, San Mateo county has passed the following resolutions, and appointed a committee in accordance therewith:

WHEREAS, The titles to the public lands of this State, known as "lieu or indemnity lands," are in a very disturbed and unsettled condition, and

WHEREAS, A large number of Patrons of Husbandry and other farmers have in good faith become actual settlers upon said lands, and whose titles are now seriously affected by this unsettled condition, therefore be it

Resolved, That a committee of three be appointed by this Grange to investigate this matter and report as soon as possible to this Grange or its Executive Committee some plan or measure by which the evil may be alleviated or corrected.

This committee, says the San Francisco *Bulletin*, certainly has an arduous task before them, one that will require months to carry out, and before they can remedy the matter, they will have to send none but honest men to make the laws, for heretofore all laws bearing upon this subject have either been directly in the interests of land speculators, or so plastered with amendments as to confuse their meaning, and render them capable of almost any construction dishonest men saw fit to put upon them. The Grange is right in one thing, certainly, that a large number of farmers have clouds upon their titles, which would never have been the case had the school grant never been made. The title to the Act is a misnomer, and should have read, "An Act to grant speculators every sixteenth and thirty-sixth section for grazing purposes, and defining the rights of the grantees against the encroachments of the people of the State of California." This is what the grant has amounted to, and it is a pity that the enacting clause and title do not conform more nearly to the Act itself.

The State Land Commissioners have undertaken the arduous task of ascertaining the names of all persons who have been possessing themselves of large quantities of State lands, together with the amount obtained and manner of procuring title. It is probable that the result of that single line of investigation, when made public, will astonish even the San Mateo Grangers. They will find two ex-Surveyor-Generals with a tract of land almost large enough to cover the State of Rhode Island. By consulting the Assessors' books in the various counties they could write a very interesting chapter on unequal taxation. They need not be surprised to find that certain large land monopolists are paying taxes at the rate of $1 per acre on lands which they are now offering and selling at $20 to $30 an acre. They will find in Ventura county 200,000 acres of land in large tracts, paying taxes at the rate of $1.50 an acre, while the land all around and between is assessed at five times that sum. They find in Sacramento a tract of land paying at the rate of $6 an acre, portions of which are now rented at $25 an acre a year, producing from sixty to ninety bushels of corn per acre. If the Grangers, or any other organization or association, can remedy this, they can strike a blow at land monopoly more potent than all the resolutions and laws that Congress can enact. Whenever these large tracts can be made to contribute their just share of taxation towards the support of State, county and General Government, then will they be speedily be put upon the market. The first and most necessary step is to procure County Assessors who are bold enough and honest enough to obey their oath of office and levy taxes on the market value of all land, without fear or favor. When this is accomplished the rest is easy. It is not the farmers alone who are interested in equalizing taxation. Every industry, trade or calling in the country is oppressed.

Of the 600,000 acres of land already listed to the State, a very small portion has been purchased by settlers, except through the land speculators. With honest administration of the affairs of the State Land Office, nearly all would have been sold to settlers in good faith, but through connivance with the land officers speculators have become possessed of the lion's share, through the infamous "lieu pot" system. Surveyor-General Minnis, on finding such a sorry state of affairs, put his foot peremptorily down, and refused to receive any more applications on lands not listed to the State, on the ground that more land had already been applied for than the State is entitled to. In doing this he called down upon his gray head the wrath of all the land-sharks, but his prompt action will have the effect of stopping further wholesale depredations, and reserve the remaining lieu for those applications which are defective. Heretofore no one outside of the land ring had any chance of getting a piece of land unless by the merest accident. These large land-grabbing firms had men with the field surveyors, and the moment the transit disclosed a 16th or 36th section upon which a United States settler had pitched his cabin, or a school section that was worth the taking, they would make a bee-line along the wharves of San Francisco, pick up enough "bummers" for their purpose, who for a mess of porridge and a glass of bad whisky, would sell the birthright which a generous government has granted to every citizen, and at the same time assign it over to the speculator. When the plats came to be filed in the Land Office a diligent search would fail to discover any vacant state lands. As showing how a few men have, by means of dummies and collusion with the State and government offices, obtained possession of thousands of acres of these lands, it may be mentioned that Miller & Lux, the land kings of California, have had patented to them over 200,000 acres of land in Merced, Fresno and Stanislaus counties, in direct violation of the law which provides that no one shall acquire title to more than 320 acres. John Smiths and William Johnson's and George Joneses appear as the applicants in these cases, but the patent books invariably show that Miller & Lux own the land and procured the patents. W. S. Chapman, the enterprising land dealer who in former times controlled one of the local land offices, has acquired title to nearly 10,000 acres in Merced and Fresno counties, through the agency of dummies. And this is only three counties in the State. The title has passed and is vested in these men, and no statute can now deprive them of it. This is independent of the enormous amount of lands located by other means, whereby these men obtained possession of the fairest portions of the great San Joaquin Valley. * * *

Lux & Miller own 600,000 acres in round numbers, and there are hundreds of others equally land burthened. Could these lands be forced to pay taxes on their market value, or what they would bring under the hammer, it would make vast difference in the rate of taxation, while it would compel the sale of millions of acres to settlers at rates that would invite immigration.

Says the San Francisco *Chronicle*: How

does sound for a landed aristocracy? Santa Clara county contains 700,000 acres, of which twenty-seven persons own 260,000; Santa Cruz county contains 320,000 acres, and thirty-one men own 112,000 acres of that; Monterey county contains 2,540,000 acres, of which thirty persons own 746,000 acres; San Luis Obispo county contains 1,500,000 acres, of which sixty-four men have gobbled up 810,000 acres; Santa Barbara county contains 1,500,000 acres, and sixty-seven men own of that 1,216,000 acres; Los Angeles county has 2,060,000 acres, of which seventy persons own 800,000 acres; San Diego has 8,500,000 acres, and fifty-six persons own 600,000 acres. These are only a few sample counties.

There is one question in this land monopoly business that we would like to see agitated. It is this: Have parties who have obtained lands fraudulently, through or in collusion with government agents, a vested right in such lands that cannot be overthrown? Ought they to be allowed to hold peaceable possession of lands so obtained? If the government permits such peculation, does it not offer a premium on rascality, and become the aider and abettor of land thieves and swindlers.—Ed. Agriculturist.

The Wild American Sumac.

Persons who have thought anything about cultivating sumac on this coast, will most likely be interested in what the *Shoe and Leather Reporter* tells us about American sumac:

"The demand for American sumac has increased largely of late years among morocco manufacturers and dyers, and many improvements have been made in its preparation. The quality of the native article has now arrived at great perfection, and mills for grinding have sprung up through the southern and middle States. It has not been a profitable business for the past years, having suffered from the depression incident to all branches of trade.

Sumac grows all over the United States, but that best suited for tanning and dyeing purposes grows spontaneously in a belt of country running from Maryland down through Virginia and the Carolinas, thence through the northern sections of Georgia, Alabama and Mississippi, and in portions of Kentucky and Tennessee. The northern climate seems too cold to develop the tanning properties of this plant, but large quantities of Pennsylvania and New York sumac are sold in the leaf to tanners of goat skins, who put it in the vats to strengthen up and keep the sewed skins from leaking, and it is also used by many tanners who wish to brighten the color of their leather.

The Indian name of sumac is kilikinick; they use it, and it is still used, to mix with tobacco for smoking purposes.

Virginia stands at the head of all the States in producing sumac, and owing to the care taken here in selecting and grinding, its quality is unsurpassed. The towns famous for the sumac trade are Lynchburg, Richmond, Fredericksburg, Alexandria and Winchester.

The season for picking sumac commences with the 1st of July and ends the last of September, or with the first frost, for this turns the leaf red, and then it is worthless. The stems, except the leaf stems, have no strength, and should not be gathered. They are full of pith, and if ground they only absorb the strength of the leaf and depreciate the value of the article. Sumac should be gathered in this way, viz: Break off the parts of the bush containing the leaves, but do not gather the blossoms or berries. Some sumac gatherers allow the leaves to wilt a few hours in the sun, while others convey them immediately into the shade or under cover. Cure it under shelter to preserve its color and strength; when it is dry, put it in bulk, and when dry and windy days set in, spread it out in beds as you would wheat or oats on a clean plank floor. Then thresh it with a flail, when the leaves and stems will break up fine, and rake out the large stems and throw them away. In drying before threshing, it should be frequently thrown over with a pitchfork to let the air get to every part of it. Remember to take out all the sticks, stems and berries. The strength is in the leaf and leaf stems.

The grinders of sumac are obliged to have ample storage room, as they purchase their supply for a year's grinding in the months of July, August and September. Care must be taken to have it thoroughly dry before packing, to avoid spontaneous combustion. Good ventilation should always be secured after it is packed.

Help in Acquiring Knowledge.—In acquiring a knowledge of the English Language, and especially in learning the meaning of words, probably no other work, nor many other books altogether, can afford so much aid as Webster's Unabridged Dictionary, with its 3000 Pictorial Illustrations, its precise and full definitions, its careful discrimination of synonymous words, and its many valuable tables. Let one family have a copy of this work, and use it faithfully, and another be with out it,—the difference in the progress of the two families in getting knowledge will be very great.

☞ No imposition, no humbugging, but fair and honorable dealing, in the undertaking line, can be had a Trueman & Woodrow's. They are not only gentlemen, and old hands at the business, but understand it in all its details, and know how to perform their duties, and can and will give satisfaction in every case. Jot this down in your memory, and it may serve you in time of need. No smoking, drinking, or horse-racing, while attending funerals.

PUBLIC SALE

OF THE ENTIRE

"Avenue Ranch Herd"

—OF—

Short-Horn Cattle

TO BE SOLD

ON THURSDAY, APRIL 5th, 1877,

AT THE

Fair Ground, near San Jose.

Circumstances render it necessary for us to close up our partnership affairs. We shall therefore sell at public sale the entire "Avenue Ranch Herd" of Short-Horn Cattle.

The proprietors believe that this will be one of the most attractive sales that has ever been made on the Pacific Coast. We shall thus offer to the public all the choice animals we have bred and collected at an immense cost, including those fine show bulls, Mason Duke 18878, Oxford Duke, and the fine Rose of Sharon Bull, Master Maynard 18881, and, in fact, the entire herd, without reserve to the highest responsible bidder, giving a rare opportunity to breeders, and all parties wishing to purchase high-bred Short-Horns.

☞ Sale Catalogues furnished on application.

CYRUS JONES & CO.

NEW DEPARTURE.

My headquarters hereafter will be in the Photographic Rooms formerly occupied by Jas. Macauley, No. 367 First Street, San Jose, where I shall be pleased to meet all my old friends and every one who may want pictures of any kind. We are prepared to make Photographs and Ferrotypes of all sizes. Pictures copied, enlarged or reduced to any size, and finished in India Ink, Water Colors or Crayon.

If you want pictures of your houses, horses, carriages, stock, machinery, or any outside work, give us a call.

We guarantee satisfaction in price and quality of work. JAY E. FULLER, Artist.

JOSEPH WOLF,

No. 360 First Street, SAN JOSE.

MANUFACTURER OF

Trusses, Shoulder Braces, Supporter for Falling of the Womb, Umbillic Trusses, etc. Keeps all kinds of Elastic Stockings.

☞ Ladies waited upon by Mrs. Wolf. Residence, 134 San Fernando St.

Improved Evergreen

Broom-Corn

A new variety, never gets red. Long, straight, and free from curl. Ripens earlier, yields better, and will bring ½ more than any other kind. By mail, 50c per qt by express $1.50 per peck $1 per bushel. Address SAMUEL WILSON, Mechanicsville, Bucks Co., Pa.

The American Bee Journal,

Established in 1861 by the late Samuel Wagner, is published at Chicago, Ill., at $1.00 a year. Its contributors are the best, most experienced, and successful Apiarists in America and Europe. It is the oldest, largest, best and most reliable Bee Paper in the English language.

Address THOMAS G. NEWMAN,
184 Clark St. Chicago, Ill.

New Vineland Temperance Colony.

Incorporated November 6th, 1876.

One hundred square miles of valuable Farm and Grazing Lands to be sold to actual settlers at a small advance on first cost, on eight years' time, interest at seven per cent. per annum.

Valuable Lands for fruits, vegetables and cereals, and requiring no irrigation.

None but stockholders to be purchasers of the lands.

In subscribing for the stock, ten per cent. is required at time of subscribing, $100 on each share of stock of the par value of $1,000

All percentages paid in on stock are received on first payment for lands.

Ample provision is made for Schools, Library, Churches, etc.

The manufacture and sale of intoxicating liquors will not be allowed on the lands of the Colony.

These lands are located in Santa Barbara County, Cal., near the Lompoc Temperance Colony, and situated for twelve miles on the Santa Ynez River.

Full particulars, contained in the regular Prospectus, will be mailed to all persons addressing the officers of the Company at Lompoc, Santa Barbara County, Cal. JAMES W. WEBB, President.

FORM OF ORGANIZATION.

The National Independent Greenback Party is is composed of Officers for the respective States and Territories and the District of Columbia.

The State Executive Committees are composed of Executive Officers of the Congressional Districts, two at large for each State and Territory and one for each Congressional District.

The County Executive Committees are composed of as many Chairmen as there may be Clubs in the respective Counties, appointed and commissioned by their County Executive, subject to the approval of the District Executive.

The Executive Officer for each State, respectively, is Chairman of the State Executive Committee.

The Executive Officer for each District respectively, is Chairman of the District Executive Committee.

The Executive Officer for each County, is Chairman of the County Committee.

Each Club is organized under the form of the Independent Party.

TEMPORARY PLATFORM.

Whereas, The industries of our country are prostrated by a false financial system which has not only deprived labor of its just reward, but has read recklessly into idleness honorable to secure work, driving them to criminality or starvation, and fostered general dishonesty in official places and financial mismanagement of all our public interests, and

Whereas The Republican and Democratic parties have utterly failed to afford any remedy and are now both pledged to the interests of the National Banks and gold speculators, who consuming class is the surplus product of industry and are using it to subvert republican institutions and centralize the powers of Government in the hands of a money oligarchy, therefore

Resolved, That the following declaration of Principles and Rights be demanded:

1st—The immediate and unconditional repeal of the Specie Resumption Act, of January 14th, 1875, (and all other acts having a tendency to increase our National debt or decrease our free currency,) and that the issue of our National Notes from the ruin resulting from its enforcement.

2nd—We recommend thorough and complete organization with the view of electing Representatives to Congress who will legislate for, and a President who will carry out the wishes of the people in this regard.

3d—We demand the issue of Legal Tender Notes by the Government receivable for all purposes, instead of the Bank Notes, and the whole circulation restored to the Government, where it belongs.

4th—That the Government has no right to issue any money which is not a full legal tender for all purposes, and that any attempt to depreciate the Government currency should be considered treasonable.

5th—It is the paramount duty of the Government in all its legislation to keep in view the full development of all legitimate business, agricultural, mining, manufacturing, commercial and public improvements.

6th—We hereby protest against any further issue of gold bonds for sales in foreign markets, by means of which we would be made for a long time to the powers of wood and drawers of water for foreign nations, and we further protest against the sale of Government bonds for the purpose of buying silver to be used as a substitute for our more convenient and less fluctuating fractional currency, which, although well calculated to enrich the owners of silver mines, yet in operation will still further oppress through taxation an already overburdened people.

7th—That the Government has no right to dispose of the public lands except to actual settlers and then only in limited quantities.

8th—A general law should be enacted exempting from all debt and from compulsory sale a uniform and sufficient homestead, to be exempt and inalienable forever and proportioned to the number and condition of those possibly dependent on it for support.

9th—That every American citizen of proper age without regard to sex should be allowed the full right of franchise.

J. C. BLAND & CO.,

Real Estate Agents

—AND—

GENERAL AUCTIONEERS.

312 Market St., San Jose,

HAVE FOR SALE, IN SANTA CLARA AND adjoining Counties, a very fine list of Grain and Stock Farms, improved and unimproved, in in tracts from 10 acres to 10,000, which they offer upon easy terms and at low prices; also, a large list of Business and Residence property in Santa Clara and San Jose. We append a partial list Having resided in this county for 26 years, and being thoroughly posted as regards Real Estate Values, we respectfully solicit all in search of Homes, Stock, or business of any kind to give us a call.

My Annual Catalogue of Vegetable and Flower Seed for 1877 will be ready by January, and sent FREE to all who apply. Customers of last season need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed house in America, a large portion of which were grown on my six seed farms. Printed directions for cultivation on every package. All seed sold from my establishment warranted to be both fresh and true to name; so far, that should it prove otherwise I will refill the order gratis. As the original introducer of the Hubbard and Marblehead Squashes, the Marblehead Cabbages, and a score of other new vegetables, I invite the patronage of all who are anxious to have their seed fresh, true, and of the very best strain. New Vegetables a specialty

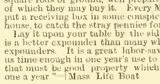
NO LIBRARY COMPLETE WITHOUT.

The Best English Dictionary.



Webster's Unabridged.

"EVERY FARMER should give his sons two or three square rods of ground, well prepared, with the avails of which they may buy it. Every MECHANIC should put a receiving box in some conspicuous place in the house, to catch the stray pennies for the like purpose. Lay it upon your table by the side of the Bible—it is a better expounder than many which claim to be expounders. It is a great laborsaver it has saved us time enough in one year's use to pay for itself, and that must be good, properly which will clear itself one a year."—Mass Life Boat
